## $N$-(2-Chloro-4-nitrophenyl)maleamic acid monohydrate

K. Shakuntala, ${ }^{\text {a }}$ Marek Fronc, ${ }^{\text {b }}$ B. Thimme Gowda ${ }^{\text {a* }}$ and Jozef Kožíšek ${ }^{\text {b }}$<br>${ }^{\text {a }}$ Department of Chemistry, Mangalore University, Mangalagangotri 574 199, Mangalore, India, and ${ }^{\mathbf{b}}$ Institute of Physical Chemistry and Chemical Physics, Slovak University of Technology, Radlinského 9, SK-812 37 Bratislava, Slovak Republic Correspondence e-mail: gowdabt@yahoo.com

Received 3 December 2011; accepted 6 December 2011
Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$; $R$ factor $=0.044 ; w R$ factor $=0.128 ;$ data-to-parameter ratio $=11.1$.

The title compound, $\mathrm{C}_{10} \mathrm{H}_{7} \mathrm{ClN}_{2} \mathrm{O}_{5} \cdot \mathrm{H}_{2} \mathrm{O}$, crystallizes with a half-molecule each of N -(2-chloro-4-nitrophenyl)maleamic acid (located on a mirror plane) and water (located on a twofold rotation axis) in the asymmetric unit. The main molecule is planar by symmetry and its conformation is stabilized by an intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bond. In the crystal, $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds link the molecules into a three-dimensional network.

## N -(2-Chloro-4-nitrophenyl)maleamic acid monohydrate

K. Shakuntala, Marek Fronc, B. Thimme Gowda and Jozef Kožíšek

## S1. Comment

The amide moiety is a constituent of many biologically significant compounds. As part of our studies on the substituent effects on the structures and other aspects of $N$-(aryl)-amides (Gowda et al., 2000; Prasad et al., 2002; Shakuntala et al., 2011), $N$-(aryl)-methanesulfonamides (Jayalakshmi \& Gowda, 2004), $N$-(aryl)-arylsulfonamides (Shetty \& Gowda, 2005) and $N$-chloroarylsulfoamides (Gowda \& Kumar, 2003), in the present work, the crystal structure of $N$-(2-chloro-4-nitro-phenyl)-maleamic acid monohydrate(I) has been determined (Fig.1).
The conformations of the $\mathrm{N}-\mathrm{H}$ and the $\mathrm{C}=\mathrm{O}$ bonds in the amide segment are anti to each other. But the conformation of the $\mathrm{N}-\mathrm{H}$ bond is syn to the ortho- Cl atom in the phenyl ring, similar to that observed between the $\mathrm{N}-\mathrm{H}$ bond and ortho-methyl group in N -(4-Chloro-2-methylphenyl)-maleamic acid (II) (Shakuntala et al., 2011).
In the maleamic acid moiety, the amide $\mathrm{C}=\mathrm{O}$ bond is anti to the adjacent $\mathrm{C}-\mathrm{H}$ bond, while the carboxyl $\mathrm{C}=\mathrm{O}$ bond is syn to the adjacent $\mathrm{C}-\mathrm{H}$ bond. The observed rare anti conformation of the $\mathrm{C}=\mathrm{O}$ and $\mathrm{O}-\mathrm{H}$ bonds of the acid group is similar to that observed in (II). This may be due to the hydrogen bond donated to the amide carbonyl group by the carboxyl group. The C2-C3 bond length of 1.327 (4) $\AA$ indicates the double bond character.
The various modes of interlinking carboxylic acids by hydrogen bonds is described elsewhere (Leiserowitz, 1976).
In (I), both the intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$, and intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds have been observed. The packing of molecules linked by intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds into infinite chains is shown in Fig. 2.

## S2. Experimental

The solution of maleic anhydride $(0.025 \mathrm{~mol})$ in toluene $(25 \mathrm{ml})$ was treated dropwise with the solution of 2-chloro-4nitroaniline $(0.025 \mathrm{~mol})$ also in toluene $(20 \mathrm{ml})$ with constant stirring. The resulting mixture was stirred for about 30 min and set aside for an additional 30 min at room temperature for the completion of reaction. The mixture was then treated with dilute hydrochloric acid to remove the unreacted 2-chloro-4-nitroaniline. The resultant solid $N$-(2-chloro-4-nitro-phenyl)-maleamic acid monohydrate was filtered under suction and washed thoroughly with water to remove the unreacted maleic anhydride and maleic acid. It was recrystallized to constant melting point from ethanol. The purity of the compound was checked and characterized by its infrared spectra.
Prism like colorless single crystals of the title compound used in X-ray diffraction studies were grown in an ethanol solution by slow evaporation ( 0.5 g in about 30 ml of ethanol) at room temperature.

## S3. Refinement

All hydrogen atoms were placed in calculated positions with $\mathrm{C}-\mathrm{H}$ distances of $0.93 \AA$ and constrained to ride on their parent atoms. Amide and and $\mathrm{O}-\mathrm{H}$ atoms were seen in difference map and were refined with the $\mathrm{N}-\mathrm{H}$ distance restrained to $0.86(1) \AA$. The $U_{\text {iso }}(\mathrm{H})$ values were set at $1.2 U_{\text {eq }}(\mathrm{C}, \mathrm{N}, \mathrm{O})$.

Figure 1
Molecular structure of the title compound showing the atom labelling scheme. Displacement ellipsoids are drawn at the $50 \%$ probability level. H atoms are represented as small spheres of arbitrary radii.

## Figure 2

Packing view of the title compound. Molecular chains along $a$-axis are generated by $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds which are shown as dashed lines. H atoms not involved in H-bonding have been omitted.

## Special details

Experimental. CrysAlisPro (Oxford Diffraction, 2009) Analytical numeric absorption correction using a multifaceted crystal model based on expressions derived (Clark \& Reid, 1995).
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
