Correspondence e-mail: jianchaoyuan@nwnu.edu.cn
Received 15 November 2011; accepted 10 December 2011
Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.052 ; w R$ factor $=0.175 ;$ data-to-parameter ratio $=15.3$.

The asymmetric unit of the title compound, $\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{~N}_{2}$, contains one half -molecule which exhibits a crystallographically imposed center of symmetry. The benzene rings are inclined to the 1,4-diazabutadiene mean plane by $78.3(2)^{\circ}$.

## Related literature

The title compound was synthesized as a $\alpha$-diimine ligand for $\mathrm{Ni}^{\mathrm{II}}-\alpha$-diimine olefin polymerization catalysts. For applications of $\alpha$-diimine ligands, see: Johnson et al. (1995); Killian et al. (1996). For the design and synthesis of new $\alpha$-diimine derivatives, see: Yuan et al. (2005); Popeney \& Guan (2005, 2010); Popeney et al. (2011). The crystal structures of Re and Ni complexes with the title ligand were reported by Kia et al. (2005) and Yuan et al. (2011), respectively.

## S1. Comment

$\alpha$-Diimine ligand nickel catalysts greatly attracted attention due to their high catalytic activity in ethylene polymerization (Johnson et al., 1995; Killian et al., 1996). Design and synthesis of the ligands is crucial (Popeney et al., 2005, 2010, 2011; Yuan et al., 2005). Herewith we present the title compound (I).
In (I) (Fig. 1), the single $\mathrm{C}-\mathrm{C}$ bond in 1,4-diazabutadiene fragment is trans-configured and situated on inversion center. The dihedral angle between the benzene ring and 1,4-diazabutadiene plane is $78.3(2)^{\circ}$. However, the transconfigured ligand can be transformed into cis-configured ligand in order to facilitate the formation of $\alpha$-diimine-metal complexes, for examples, see Yuan et al. (2011) for Ni complex, and Kia et al. (2005) for Re complex.

## S2. Experimental

Formic acid ( 1 ml ) was added to a stirred solution of 2,3-butanedione ( $0.052 \mathrm{~g}, 0.6 \mathrm{mmol}$ ) and 2,4-dimethylaniline ( 0.144 $\mathrm{g}, 1.2 \mathrm{mmol}$ ) in methanol ( 30 ml ). The mixture was refluxed for 24 h , then cooled and the precipitate was separated by filtration. The solid was recrystallized from ethanol/dichloromethane ( $v / v=8: 1$ ), washed and dried under vacuum. Yield: $0.160 \mathrm{~g}(82 \%)$. Crystals suitable for X-ray structure determination were grown from a solution of the title compound in a mixture of cyclohexane/dichloromethane ( $1: 2, v / v$ ).

## S3. Refinement

All hydrogen atoms were placed in calculated positions with $\mathrm{C}-\mathrm{H}$ distances of 0.93 and $0.96 \AA$ for aryl and methyl type H -atoms, respectively. They were included in the refinement in a riding model approximation, with $U$ iso $=1.2-1.5 U_{\mathrm{eq}}(\mathrm{C})$.

## Figure 1

The molecular structure of the title compound, with the atom-labelling scheme [symmetry code: (a) 1-x,2-y,1-z]. Displacement ellipsoids are shown at the $30 \%$ probability level.

0 restraints
Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map

> Hydrogen site location: inferred from neighbouring sites
> H -atom parameters constrained
> $w=1 /\left[\sigma^{2}\left(F_{\sigma_{0}}\right)^{2}+(0.0962 P)^{2}+0.2091 P\right]$
> where $P=\left(F_{0}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$
> $(\Delta / \sigma)_{\max }<0.001$
> $\Delta \rho_{\max }=0.21 \mathrm{e} \AA^{-3}$
> $\Delta \rho_{\min }=-0.15 \mathrm{e} \AA^{-3}$
> Extinction correction: $S H E L X L 97$ (Sheldrick, 2008), Fc $\mathrm{Fc}^{*}=\mathrm{kFc}\left[1+0.001 \times \mathrm{FFc} \mathrm{F}^{2} \lambda^{3} / \sin (2 \theta)\right]^{-1 / 4}$
> Extinction coefficient: $0.009(4)$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) $e t c$. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
