## 4,4'-Bipyridine-dimethylglyoxime (1/1)

## Yan Yang, Ziping Huang, Haitang Lv and Aixia Han*

College of Chemical Engineering,Qinghai University, Xining 810016, People's Republic of China
Correspondence e-mail: yyan217@163.com
Received 14 November 2011; accepted 17 December 2011
Key indicators: single-crystal X-ray study; $T=298 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.043 ; w R$ factor $=0.133 ;$ data-to-parameter ratio $=17.6$.

In the title compound, $\mathrm{C}_{10} \mathrm{H}_{8} \mathrm{~N}_{2} \cdot \mathrm{C}_{4} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{O}_{2}$, both the dimethylglyoxime and the $4,4^{\prime}$-bipyridine molecules have crystallographic $C_{\mathrm{i}}$ symmetry. The molecules stack along the $a$-axis direction with a dihedral angle of 20.4 (8) ${ }^{\circ}$ between their planes. In the crystal, the components are linked by $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds into alternating chains along [120] and [1立0].

## 4,4'-Bipyridine-dimethylglyoxime (1/1)

Yan Yang, Ziping Huang, Haitang Lv and Aixia Han

## S1. Comment

Dimethylglyoxime $\left(\mathrm{H}_{2} \mathrm{dmg}\right)$ with its two oximate group $(=\mathrm{N}-\mathrm{O}-)$ is a suitable scaffold to construct metal-containing building blocks for extended supramolecular architectures. Several complexes of transition metals with this ligand and its derivatives have been reported (Malinovskii et al., 2004; Coropceanu et al., 2009). Moreover, the NO oxime group has a remarkable efficiency to mediate magnetic interactions when it acts as a bridging ligand (Cervera et al., 1997).
Starting from $\mathrm{Mn}\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{2}$ and $\mathrm{H}_{2} \mathrm{dmg}$, and using 4,4'-dpy as a bridging ligand, we have aimed to prepare a complex with superior magnetic properties. However, the reaction resulted in a stoichiometric (1:1) molecular complex of di-methylglyoxime-4,4'-bipyridine.
In this structure, the molecules of $\mathrm{H}_{2} \mathrm{dmg}$ and 4,4'-dpy are linked through $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds into alternating chains (Fig. 2).

## S2. Experimental

$\mathrm{Mn}\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{2} .4 \mathrm{H}_{2} \mathrm{O}(0.025 \mathrm{~g}, 0.1 \mathrm{mmol})$ in 5 ml of water and $\mathrm{CH}_{3} \mathrm{COONa}(0.016 \mathrm{~g}, 0.2 \mathrm{mmol})$ were added to a mixture of $\mathrm{H}_{2} \mathrm{dmg}(0.024 \mathrm{~g}, 0.2 \mathrm{mmol})$ and $4,4^{\prime}$-dpy in 10 ml of methanol. The reaction mixture was boiled in a crucible for $\sim 10$ min. The solvent was then evaporated and colorless crystals of the title compound were obtained.

## S3. Refinement

Methyl H atoms were placed in calculated position with $\mathrm{C}-\mathrm{H}=0.96 \AA$, and torsion angles were refined, $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{C})$. The position of the O-bound H -atom was determined from a difference Fourier map and then geometrically restrained with $\mathrm{O}-\mathrm{H}=0.82 \AA$, and $U_{\mathrm{iso}}(\mathrm{H})=1.5 U_{\mathrm{eq}}(\mathrm{O})$. Aromatic H atoms were placed in calculated positions with $\mathrm{C}-\mathrm{H}=0.93 \AA$ and refined in riding mode with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
