Received 28 November 2011; accepted 9 December 2011
Key indicators: single-crystal X-ray study; $T=298 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$;
$R$ factor $=0.029 ; w R$ factor $=0.083$; data-to-parameter ratio $=7.0$.

In the title compound, $\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{~N}_{2} \mathrm{O}_{2}$, both imidazole N atoms are protonated and carboxylate group is deprotonated, resulting in a zwitterion. The molecule is essentially planar, with an r.m.s. deviation of 0.012 (1) $\AA$. In the crystal, $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds and $\pi-\pi$ stacking interactions [centroidcentroid distance $=3.674(2) \AA$ ] between the imidazole rings link the molecules into a three-dimensional supramolecular network.

## 1H-Imidazol-3-ium-4-carboxylate

Qiang Cao, Bao-Rong Duan, Bin Zhu and Zhen Cao

## S1. Comment

The organic ligands containing N and O donors, especially the N -heterocyclic carboxylates, are ideal candidates for constructing novel metal coordination polymers, because of their versatile coordination modes and potential hydrogen bonding donors and acceptors. Particular attention has been paid to the 1 H -imidazole-4,5-dicarboxylic acid ligand ( $\mathrm{H}_{3}$ IDC), because it can coordinate with metal ions in different coordination fashions to offer a series of complexes with diverse structures and interesting properties (Alkordi, Liu et al., 2008; Alkordi, Brant et al., 2009; Gu et al., 2010; Lu et al., 2006; Nouar et al., 2009; Wang et al., 2010). Recently, an analogue of $\mathrm{H}_{3}$ IDC, $1 H$-imidazole-4-carboxylic acid ( $\mathrm{H}_{2} \mathrm{IMC}$ ), has also been used to prepare new coordination polymers (Haggag, 2005; Starosta \& Leciejewicz, 2006; Gryz et al., 2007; Yin et al., 2009; Shuai et al., 2011; Zheng et al., 2011). However, the crystal structure of $\mathrm{H}_{2} \mathrm{IMC}$ ligand has not been determined. With this in mind, we attempteted to obtain its crystal structure that is reported here.
As illustrated in Fig. 1, the title compound, $\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{~N}_{2} \mathrm{O}_{2}$, crystallizes as a zwitterion in which the imidazole N atom is protonated and the carboxylate group is deprotonateded. In the crystal structure, intermolecular $\mathrm{N} 2-\mathrm{H} 2 \cdots \mathrm{O} 2^{\mathrm{i}}$ and $\mathrm{N} 1-$ $\mathrm{H} 1 \cdots \mathrm{O} 1^{\text {ii }}$ hydrogen bonds (Table 1) [symmetry code: (i) $-x+1 / 2, y-1 / 2, z+1 / 2$; (ii) $-x,-y+1, z+1 / 2$ ] between the imidazole $\mathrm{N}-\mathrm{H}$ groups and carboxylate O atoms link the molecules into a three-dimensional supramolecular network (Fig. 2). Moreover, the crystal structure is further stabilized by $\pi-\pi$ stacking interactions between neighbouring imidazole rings $\left[\mathrm{N} 2-\mathrm{C} 4-\mathrm{N} 1-\mathrm{C} 2-\mathrm{C} 3\right.$ and $\mathrm{N} 2^{\mathrm{v}}-\mathrm{C} 4^{\mathrm{v}}-\mathrm{N} 1^{\mathrm{v}}-\mathrm{C} 2^{\mathrm{v}}-\mathrm{C} 3^{\mathrm{v}}$, symmetry code: $\left.(\mathrm{v}) x, y, z+1\right]$, with centroid $\cdots$ centroid distances of 3.674 (2) $\AA$ (Fig. 2).

## S2. Experimental

The compound was synthesized from 1 H -imidazole-4,5-dicarboxylic acid according to the method reported in the literature (Davis et al., 1982). Colourless single crystals suitable for X-ray diffraction were prepared by slow evaporation of a solution of the title compound in water at room temperature.

## S3. Refinement

All non-hydrogen atoms were assigned anisotropic displacement parameters in the refinement. The zwitter-ionic structure was established from a difference Fourier synthesis. Consequently, all hydrogen atoms were positioned geometrically and refined using a riding model, with $\mathrm{C}-\mathrm{H}=0.93 \AA$ and $\mathrm{N}-\mathrm{H}=0.86 \AA$ and with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C}, \mathrm{N})$. Since this is a light atom structure (does not contain any atoms heavier than Si ) and since the data collection was carried out using Mo radiation, it was not possible to unambiguously determine the absolute configuration of this molecule. In the absence of significant anomalous scattering effects Friedel pairs have been merged.

Figure 1
The structure of the title compound, showing the atom-labelling scheme and displacement ellipsoids drawn at the $30 \%$ probability level.

Figure 2
A view showing part of the three-dimensional supramolecular network linked by $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds and $\pi-\pi$ stacking interactions. Hydrogen bonds and $\pi-\pi$ stacking interactions are shown as dashed lines. Symmetry codes: (i) $-x+$ $1 / 2, y-1 / 2, z+1 / 2$; (ii) $-x,-y+1, z+1 / 2$; (v) $x, y, z+1$.

$\Delta \rho_{\min }=-0.19 \mathrm{e}^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
