Received 16 November 2011; accepted 30 November 2011

Key indicators: single-crystal X-ray study; $T=297 \mathrm{~K}$; mean $\sigma(\mathrm{N}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.030 ; w R$ factor $=0.068$; data-to-parameter ratio $=13.5$.

The title structure, $\quad 3 \mathrm{C}_{2} \mathrm{H}_{7} \mathrm{~N}_{4} \mathrm{O}^{+} \cdot \mathrm{HFPO}_{3}{ }^{-} \cdot \mathrm{FPO}_{3}{ }^{2-} \cdot \mathrm{H}_{2} \mathrm{O}$, contains three independent 2-carbamoylguanidinium cations, one fluorophosphonate, one hydrogen fluorophosphonate and one water molecule. There are three different layers in the structure that are nearly perpendicular to the $c$ axis. Each layer contains a cation and the layers differ by the respective presence of the water molecule, the hydrogen fluorophosphonate and fluorophosphonate anions. $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds between the guanylurea molecules that interconnect the molecules within each layer are strong. The layers are interconnected by strong and weak $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds between the anions and water molecules, respectively. Interestingly, the configuration of the layers is quite similar to that observed in 2-carbamoylguanidinium hydrogen fluorophosphonate [Fábry et al. (2012). Acta Cryst. C68, o76-o83]. There is also present a $\mathrm{N}-\mathrm{H} \cdots \mathrm{F}$ hydrogen bond in the structure which occurs quite rarely.

# Tris(2-carbamoylguanidinium) hydrogen fluorophosphonate fluorophosphonate monohydrate 

Jan Fábry, Michaela Fridrichová, Michal Dušek, Karla Fejfarová and Radmila Krupková

## S1. Comment

Preparation of the title structure was stimulated by the study of 2-carbamoylguanidinium hydrogen fluorophosphonate (Fábry et al., 2011a) and the isostructural 2-carbamoylguanidinium hydrogen phosphite (Fridrichová et al., 2010a). It turned out that both compounds form mixed crystals (Fábry et al., 2011a). 2-carbamoylguanidinium hydrogen phosphite (Fridrichová et al., 2010a) shows interesting optical properties (Fridrichová et al., 2010b; Kroupa \& Fridrichová, 2011). These compounds were grown from equimolar solutions of the cations and anions.

In order to extend the study of the system guanylurea - fluorophosphonate there have been carried out experiments on the crystal growth from the solutions of different molar ratios of the 2-carbamoylguanidinium cation and the fluorophosphonate. One of such experiments resulted in preparation of the title structure and the other one in preparation of two polymorphs of bis[guanylurea)(1+)] fluorophosphonate dihydrate (Fábry et al., 2011b).

The title structure contains three independent 2-carbamoylguanidinium molecules, one fluorotrixophosphate, one hydrogen fluorophosphonate and the water molecule (Fig. 1). The layers, which are nearly perpendicular to the $c$ axis, are interconnected by the $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds between the fluorophosphonate, the hydrogen fluorophosphonate and the water molecules (Fig. 2; Tab. 1). The hydrogen bond between the fluorophosphonate and the hydrogen fluorophosphonate is quite strong (Desiraju \& Steiner, 1999) in contrast to the weaker ones between the water molecule and the O atoms of the hydrogen fluorophosphonate and the fluorophosphonate.

The geometrical parameters of both anions are in accordance with the observed values in these anions in other structures (Fábry et al., 2011a; deposited material at the end of the CIF). Fig. 3 shows that the $\left[\mathrm{PO}_{3} \mathrm{~F}\right]^{2-}$ anion in the title structure is situated in the region where the anion can be affected as an acceptor of the hydrogen bond, $i$. $e$. close to the intermediate region of $\left[\mathrm{H} \cdots \mathrm{PO}_{3} \mathrm{~F}\right]^{-}$. Indeed, the involvement of O 21 in the strong hydrogen bond $\mathrm{O} 11-\mathrm{H} 1 \mathrm{o} 11 \cdots \mathrm{O} 21$ is accompanied by the concomitant shortening of the $\mathrm{P}-\mathrm{F}$ bond length, i.e. of $\mathrm{P} 2-\mathrm{F} 2$ in the present case. A similar, even more pronounced effect has recently been observed in bis[guanylurea)(1+)] fluorophosphonate dihydrate (Fábry et al., 2011b).

On the other hand, the position of $\left[\mathrm{HPO}_{3} \mathrm{~F}\right]^{-}$corresponds to the full hydrogenation of the anion. This is in accordance with the refined position of the hydroxyl hydrogen that is situated close to the donor oxygen despite of the short O $\mathrm{H} \cdots \mathrm{O}$ hydrogen bond between both anions.
The 2-carbamoylguanidinium cations within each layer are interconnected between themselves by the $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Fig. 2; Figs. 4-6). These hydrogen bonds are bent with 135 (2) ${ }^{\circ}$ as maximum for N2-H1n2 $\cdots \mathrm{O} 1$ (Tab. 2). Moreover, the 2-carbamoylguanidinium cations which are situated in respective layers are also interconnected by the $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds with water molecules (layer 1; Fig. 4), hydrogen fluorophosphonates (layer 2, Fig. 5) and fluorophosphonates (layer 3, Fig. 6). It is interesting that the secondary amines form stronger $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds than the primary ones (Tab. 2). Similarly as in 2-carbamoylguanidinium hydrogen fluorophosphonate (Fábry et al.,

2011a) all the amine H atoms are involved in the hydrogen bonds (Tab. 2) with $\mathrm{H} \cdots \mathrm{O}$ (acceptor) spanning the range 1.93 $\sim 2.40 \AA$. This means that these hydrogen bonds are considered as the strong and weak hydrogen bonds (Desiraju \& Steiner, 1999).
The title structure is rather unusual for presence of a rare $\mathrm{N} — \mathrm{H} \cdots \mathrm{F}$ hydrogen bond (Dunitz \& Taylor, 1997; Krupková et al., 2002) where F belongs to the hydrogen fluorophosphonate (Fig. 5). Nevertheless, all the patterns in the layers are quite similar (Figs. 4-6, Tab. 2). The hydrogen bond motif of the layer 2 (Fig. 5, Tab. 2) corresponds quite well to that of 2-carbamoylguanidinium hydrogen fluorophosphonate (Fábry et al. (2011a); Fig. 7).
$\chi^{2}$ indices regarding the planes fitted through all the non-hydrogen cation's atoms equal to $1048.019,158.651$ and 22.287 for N1, C1, N2, N3, C2, O1, N4; N5, C3, N6, N7, C4, O2, N8 and N9, C5, N10, N11, C6, O3, N12., respectively. Interestingly, in the motif observed in 2-carbamoylguanidinium hydrogen fluorophosphonate (Fábry et al., 2011a; Fig. 7), the $\chi^{2}$ index equals to 1139.577 .

## S2. Experimental

The structures were prepared by neutralization of stoichiometric amounts of guanylurea hydroxide and $\mathrm{H}_{2} \mathrm{PO}_{3} \mathrm{~F}$. Guanylurea hydroxide was prepared from guanylurea hydrochloride hemihydrate by an exchange reaction on anex.
Guanylurea chloride hemihydrate has been described at the beginning of the $20^{- \text {th }}$ century (Ostrogovich, 1911) and thoroughly characterized by Scoponi et al. (1991). It was prepared by acid hydrolysis of cyanoguanidine according to Fig. 8. Diluted water solution ( 100 ml of water to every 0.1 mol of cyanoguanidine) of equimolar ratios of cyanoguanidine ( $99 \%$, Sigma-Aldrich) and hydrochloric acid (p.a., Lachema) was gradually heated. After about 45 minutes, when the reaction mixture started boiling, the originally colourless mixture suddenly became greyish and cloudy for a while and then an exothermal process occurred. This process was accompanied by very intense boiling of the reaction mixture. The heating was immediately interrupted and the reaction mixture was placed on a cold magnetic stirrer and it was stirred for another 15 minutes. The liquid which in the meanwhile had turned coulourless again was heated to the boiling point and kept heated for 2 h . Then the excessive water was evaporated under vacuum and a white crystalline product was filtered off. It was purified by recrystallization from water and characterized by powder XRD and found to be identical to the structure JODZOR (Cambridge Crystallographic Database (Allen, 2002; Scoponi et al., 1991). IR spectrum was recorded, too, in order to exclude possibility of contamination of the product by cyanoguanidine. The IR spectrum was in accordance with the compound described by Scoponi et al. (1991), whereas the intense doublet of $\mathrm{CN}^{-}$ group typical for cyanoguanidine was absent.
The solution of $\mathrm{H}_{2} \mathrm{PO}_{3} \mathrm{~F}$ was prepared from solution of $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{PO}_{3} \mathrm{~F} . \mathrm{H}_{2} \mathrm{O}$ that passed through the column of catex. $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{PO}_{3} \mathrm{~F} . \mathrm{H}_{2} \mathrm{O}$ was prepared by the method described by Schülke \& Kayser (1991) and the raw material of $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{PO}_{3} \mathrm{~F} . \mathrm{H}_{2} \mathrm{O}$ prepared by this method was recrystallized in order to get rid of contamination of $\left(\mathrm{NH}_{4}\right) \mathrm{H}_{2} \mathrm{PO}_{4}$. The volume of the eluted solution of $\mathrm{H}_{2} \mathrm{PO}_{3} \mathrm{~F}$ was about 50 ml in both cases. The solutions were put into the evacuated desiccator over $\mathrm{P}_{4} \mathrm{O}_{10}$. The crystals appeared in one week. The crystals deteriorated quickly on air, possibly because of the mother liquor that remained on the surface of the crystals that could react with air humidity. The crystals were put into the special glass capillaries. For the title structure $0.74 \mathrm{~g}\left(\mathrm{NH}_{4}\right)_{2} \mathrm{PO}_{3} \mathrm{~F}_{2} \mathrm{H}_{2} \mathrm{O}$ and 1 g of guanylurea hydroxide was applied. It should be added that the experiments in repeated preparation failed and different crystals have been prepared (Fábry et al., 2012b).

## S3. Refinement

All the H atoms were discernible in the difference electron density map. The hydroxyl hydrogen H1o11 of the hydrogen fluorophosphonate was refined freely. The coordinates of the atom P1 have not been refined because of the fixing of the
origin in the space group of the title structure. There have been applied the following restraints: Water H atoms were restrained to be distant 0.820 (1) $\AA$ from the water oxygen Ow while the $\mathrm{H} 1 \mathrm{ow}-\mathrm{Ow}-\mathrm{H} 2 \mathrm{ow}$ angle was restrained to equal to $107.90(1)^{\circ}$. [The latter value was retrieved from the neutron diffraction structure determinations contained in the Cambridge Crystal Structure Database (Allen, 2002).] The primary amine hydrogen distances were restrained to 0.860 (1) $\AA$ and the angle H1n10-N10-H2n10 was restrained to $120.00(1)^{\circ}$. The geometry of the secondary amine groups N3, N7 and N11 were constrained as planar (i.e. their neighbours were situated in the plane together with the secondary amine groups) with the $\mathrm{N} — \mathrm{H}$ distances equal to $0.89 \AA$. The isotropic amine H atoms' displacement parameters have been constrained to 1.2 multiple of $U_{\text {eq }}$ of the respective carrier N atoms while the $U_{\text {iso }}$ of the water H atoms equalled to 1.5 multiple of $U_{\text {eq }}$ of the water oxygen. 2216 Friedel pairs have been used in the refinement. The $x, y$ and $z$ fractional coordinates of P 1 atom have been fixed during the refinement.

Figure 1
View of the constituent molecules and ions of the title structure; the displacement ellipsoids are depicted at the 50\% probability level (Spek, 2009).

Figure 2
View of the unit cell of the title structure (Brandenburg, 2010.)

## Figure 3

Plot of $\mathrm{P}-\mathrm{F} v s$. the longest $\mathrm{P}-\mathrm{O}$ bond lengths in the molecules of hydrogen fluorophosphonate and fluorophosphonate. The plot was constructed by Origin (OriginLab, 2000). The title anions are symbolized by blue triangles; the left triangle corresponds to the fluorophosphonate while the right one to the hydrogen fluorophosphonate in the structure. For the list of the structures that entered into this plot, see the deposited material or Fábry et al. (2012a).

Figure 4
View of the hydrogen bond pattern within the layer with $z \backslash \operatorname{sim} 0.0$ of the title structure. This layer contains the water molecules (Brandenburg, 2010).

Figure 5
View of the hydrogen bond pattern within the layer with $z \sim 0.3$ of the title structure. This layer contains hydrogen fluorophosphonate (Brandenburg, 2010). Compare with Fig. 7.

Figure 6
View of the hydrogen bond pattern within the layer with $z \sim 0.6$ of the title structure. Symmetry code: (i) $x, y, z+1$. This layer contains fluorophosphonate (Brandenburg, 2010).

Figure 7
Section of guanylurea hydrogen fluorophosphonate (Fábry et al., 2012a) showing the hydrogen-bond pattern (Brandenburg, 2010). Compare with Fig. 5.

Figure 8
Scheme of the preparation of guanylurea.

## Tris(2-carbamoyIguanidinium) hydrogen fluorophosphonate fluorophosphonate monohydrate

## Crystal data

$3 \mathrm{C}_{2} \mathrm{H}_{7} \mathrm{~N}_{4} \mathrm{O}^{+} \cdot \mathrm{HFO}_{3} \mathrm{P}^{-} \cdot \mathrm{FO}_{3} \mathrm{P}^{2-} \cdot \mathrm{H}_{2} \mathrm{O}$
$M_{r}=524.3$
Triclinic, $P 1$
Hall symbol: P 1
$a=6.7523$ (3) $\AA$
$b=8.2926$ (3) $\AA$
$c=9.7297$ (4) $\AA$
$\alpha=100.630(3)^{\circ}$
$\beta=90.885(3)^{\circ}$
$\gamma=99.168(3)^{\circ}$
$V=528.05(4) \AA^{3}$

## Data collection

Oxford Diffraction Xcalibur Gemini ultra diffractometer
Radiation source: Enhance (Mo) X-ray Source
Graphite monochromator
Detector resolution: 10.3784 pixels $\mathrm{mm}^{-1}$
$\omega$ scans
Absorption correction: multi-scan
(CrysAlis PRO, Oxford Diffraction, 2010)
$T_{\text {min }}=0.852, T_{\text {max }}=0.888$

## Refinement

Refinement on $F^{2}$
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.030$
$w R\left(F^{2}\right)=0.068$
$S=1.52$
4769 reflections
352 parameters
22 restraints
35 constraints
Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map
Hydrogen site location: difference Fourier map
$Z=1$
$F(000)=272$
$D_{\mathrm{x}}=1.648 \mathrm{Mg} \mathrm{m}^{-3}$
Mo $K \alpha$ radiation, $\lambda=0.7107 \AA$
Cell parameters from 5951 reflections
$\theta=3.0-29.2^{\circ}$
$\mu=0.30 \mathrm{~mm}^{-1}$
$T=297 \mathrm{~K}$
Prism, colourless
$0.60 \times 0.45 \times 0.40 \mathrm{~mm}$

8499 measured reflections
4769 independent reflections
4203 reflections with $I>3 \sigma(I)$
$R_{\text {int }}=0.018$
$\theta_{\text {max }}=29.3^{\circ}, \theta_{\text {min }}=3.0^{\circ}$
$h=-9 \rightarrow 8$
$k=-11 \rightarrow 11$
$l=-13 \rightarrow 12$

H atoms treated by a mixture of independent and constrained refinement
Weighting scheme based on measured s.u.'s $w=$ $1 /\left[\sigma^{2}(I)+0.0004 I^{2}\right]$
$(\Delta / \sigma)_{\text {max }}=0.042$
$\Delta \rho_{\max }=0.19 \mathrm{e}^{-3}$
$\Delta \rho_{\text {min }}=-0.16$ e $\AA^{-3}$
Extinction correction: B-C type 1 Lorentzian isotropic (Becker \& Coppens, 1974)
Extinction coefficient: 700 (200)
Absolute structure: Flack (1983), 2216 Friedel pairs
Absolute structure parameter: 0.08 (6)

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters ( $\hat{A}^{2}$ )
