Received 3 December 2011; accepted 20 December 2011

Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$; disorder in main residue; $R$ factor $=0.049 ; w R$ factor $=0.138$; data-to-parameter ratio $=19.9$.

In the title pyrazoline derivative, $\mathrm{C}_{14} \mathrm{H}_{12} \mathrm{ClN}_{3} \mathrm{~S}_{2}$, the thiophene ring is disordered over two orientations with a refined siteoccupancy ratio of 0.832 (4):0.168 (4). The pyrazoline ring adopts an envelope conformation with the C atom linking the thiophene ring at the flap. The dihedral angles between the benzene ring and the major and minor components of the thiophene ring are 88.6 (3) and $85.6(15)^{\circ}$, respectively while the dihedral angle between the disorder components of the ring is $3.1(16)^{\circ}$. The mean plane of the pyrazoline ring makes dihedral angles of 11.86 (13), 80.1 (3) and $83.0(15)^{\circ}$, respectively, with the benzene ring, and the major and minor components of the thiophene ring. An intramolecular N (amide) $-\mathrm{H} \cdots \mathrm{N}($ pyrazoline $)$ hydrogen bond generates an $S(5)$ ring motif. In the crystal, molecules are linked by weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{S}$ and N (amide) $-\mathrm{H} \cdots \mathrm{S}$ interactions into a tape along [10 $\overline{1}] . \mathrm{C}-\mathrm{H} \cdots \pi$ interactions are also observed.

## supporting information

## 3-(4-Chlorophenyl)-5-(thiophen-2-yl)-4,5-dihydro-1H-pyrazole-1-carbothioamide

## Hoong-Kun Fun, Thitipone Suwunwong and Suchada Chantrapromma

## S1. Comment

The synthesis of pyrazoline derivatives which contain 5-membered heterocyclic structure have attracted a lot of interests in many fields, for example as in medicinal chemistry owing to their biological properties such as antiamoebic (Husain et al., 2008), anti-inflammatory (Shoman et al., 2009), analgesic (Khode et al., 2009) and antioxidant (Taj et al., 2011) activities, as well as in fluorescence (Bai et al., 2007; Gong et al., 2011) studies. Our on-going research on biological activities and fluorescent property of pyrazoline derivatives has led us to synthesize the title compound (I) in order to compare its biological activity with the related compounds (Fun et al., 2011; Nonthason et al., 2011).
In the molecule of $(\mathrm{I}), \mathrm{C}_{14} \mathrm{H}_{12} \mathrm{ClN}_{3} \mathrm{~S}_{2}$, the thiophene ring is disordered over two positions with the refined site-occupancy ratio of 0.832 (4):0.168 (4). The dihedral angles between the benzene and the major and minor components of the thiophene rings are 88.6 (3) and $85.6(15)^{\circ}$ respectively. The pyrazoline ring is in an envelope conformation [pucker atom at C5 with deviation of -0.125 (3) $\AA$ ] with puckering parameter $\mathrm{Q}=0.206$ (3) $\AA$ and $\varphi=137.6$ (7) ${ }^{\circ}$ (Cremer \& Pople, 1975). The dihedral angle between the mean plane through pyrazoline ring and the benzene ring is $11.86(13)^{\circ}$, whereas these values are 80.1 (3) and $83.0(15)^{\circ}$ between the pyrazoline and the major and minor components of the thiophene ring. The carbothioamide unit lies almost on the same plane with pyrazoline ring as can be indicated by the torsion angles $\mathrm{N} 2-\mathrm{N} 1-\mathrm{C} 14-\mathrm{N} 3=-3.3(4)^{\circ}$ and $\mathrm{C} 5-\mathrm{N} 1-\mathrm{C} 14-\mathrm{S} 2=0.4(3)^{\circ}$. Intramolecular N3-H1N3 $\cdots \mathrm{N} 2$ hydrogen bond generate an $\mathrm{S}(5)$ ring motif (Bernstein et al., 1995). Bond distances of (I) are in normal range (Allen et al., 1987)
In the crystal packing, (Fig. 2), the molecules are linked by weak C5-H5A $\cdots$ S1A intermolecular interactions (Table 1) into cyclic centrosymmetric $R^{2}{ }_{2}(8)$ dimers (Bernstein et al., 1995). These dimers are further linked by N3—H2N3 $\cdots \mathrm{S} 2$ hydrogen bonds (Table 1) into a tape along the [10 $\overline{1}]$ direction (Fig. 2). The crystal is stabilized by $\mathrm{N}-\mathrm{H} \cdots \mathrm{S}$ hydrogen bonds together with weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{S}$ and $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions (Table 1 ).

## S2. Experimental

The title compound was synthesized by dissolving (E)-1-(4-chlorophenyl)-3-(2-thienyl)prop-2-en-1-one ( $0.25 \mathrm{~g}, 1.0$ $\mathrm{mmol})$ in a solution of $\mathrm{KOH}(0.06 \mathrm{~g}, 1.0 \mathrm{mmol})$ in ethanol $(20 \mathrm{ml})$. An excess thiosemicarbazide $(0.14 \mathrm{~g}, 1.5 \mathrm{mmol})$ in ethanol ( 20 ml ) was then added, and the reaction mixture was vigorously stirred and refluxed for 4 h . The pale-yellow solid of the title compound obtained after cooling of the reaction was filtered off under vacuum. Pale yellow needleshaped single crystals of the title compound suitable for $X$-ray structure determination were recrystalized from $\mathrm{CH}_{3} \mathrm{OH} / \mathrm{CH}_{2} \mathrm{Cl}_{2}(1: 1 \mathrm{v} / \mathrm{v})$ by slow evaporation of the solvent at room temperature after several days.

## S3. Refinement

Amide H atoms were located in a difference map and refined isotropically. The remaining H atoms were positioned geometrically and allowed to ride on their parent atoms, with $\mathrm{d}(\mathrm{C}-\mathrm{H})=0.95 \AA$ for aromatic and $0.99 \AA$ for $\mathrm{CH}_{2}$ atoms.

The $U_{\text {iso }}$ values were constrained to be $1.2 U_{\text {eq }}$ of the carrier atoms. The thiophene ring is disordered over two positions with the refined site-occupancy ratio of 0.832 (4):0.168 (4). In the final refinement, distances restraint was used. The highest residual electron density peak is located at $1.35 \AA$ from Cl 1 and the deepest hole is located at $0.52 \AA$ from Cl1. The crystal was a pseudo-merohedral twin and the structure was refined with the twin law (-1000-10001). The BASF was refined to 0.138 (1).

## Figure 1

The molecular structure of the title compound, showing $45 \%$ probability displacement ellipsoids and the atom-numbering scheme. Open bond show the minor $B$ component. Intramolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond was shown as dash line.

Figure 2
The crystal packing of the title compound viewed along the $a$ axis. Only the major component was shown. For clarify, only H atoms involved in hydrogen bonds were shown. Hydrogen bonds were shown as dashed lines.

> $(\Delta / \sigma)_{\text {max }}=0.002$
> $\Delta \rho_{\text {max }}=0.33$ e $\AA^{-3}$
> $\Delta \rho_{\text {min }}=-0.59 \mathrm{e}^{-3}$

## Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier \& Glazer, 1986) operating at 100.0 (1) K.
Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. Refinement of $\mathrm{F}^{2}$ against ALL reflections. The weighted R -factor wR and goodness of fit S are based on $\mathrm{F}^{2}$, conventional R-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \operatorname{sigma}\left(\mathrm{~F}^{2}\right)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on $\mathrm{F}^{2}$ are statistically about twice as large as those based on F , and R - factors based on ALL data will be even larger.
