Received 13 April 2012; accepted 18 April 2012

Key indicators: single-crystal X-ray study; $T = 113$ K; mean $\sigma(\text{C}-\text{C}) = 0.002$ Å; R factor = 0.027; wR factor = 0.061; data-to-parameter ratio = 17.0.

In the title compound, $\text{C}_{10}\text{H}_{14}\text{NO}_4^+\cdot\text{Cl}^-$, the benzene ring makes a dihedral angle of $64.68(4)^\circ$ with the methylamino-propanoate unit, which is bonded to the catechol ring *via* a methylene C atom. A strong intramolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen bond occurs. In the crystal, $\text{O}-\text{H}\cdots\text{O}$, $\text{N}-\text{H}\cdots\text{Cl}$ and $\text{O}-\text{H}\cdots\text{Cl}$ hydrogen bonds and weak $\text{C}-\text{H}\cdots\text{O}$ interactions link the molecules into a three-dimensional network.

3-(3,4-Dihydroxyphenyl)-1-methoxy-1-oxopropan-2-aminium chloride

Ze-Feng Hou, Juan Feng, Jing-Tian Liu, Xiao-Li Zhen and Jian-Rong han han

S1. Comment

A systemic or subcutaneous infusion of *L*-Dopa methyl ester to patients suffering from Parkinson's disease who experience response fluctuations may provide a means of maintaining mobility (Cooper *et al.*, 1984). In this article, we report the synthesis and crystal structure of *L*-Dopa methyl ester hydrochloride.

In the title compound (Fig. 1), benzene ring makes a dihedral angle of 64.68 (4)° with the methylaminopropanoate moiety (N1/C8–C10/O3/O4) bonded to the catechol ring *via* a methylene C7 atom. The torsion angles in the chain connected with the aromatic ring (C6/C7–C8/N1) and (C6/C7–C8/C9) are 71.39 (19) and -50.5 (2)°, respectively. The crystal packing is stabilized by strong intermolecular O—H···O, N—H···Cl and O—H···Cl hydrogen bonds and further consolidated by weak C—H···O interactions; all the interactions link the molecules into an infinite network (Table 1 and Fig. 2).

The bond distances and bond angles in the title compound are in agreement with the corresponding bond lengths and bond angles reported in the crystal structure of a closely related compound (Naicker *et al.*, 2012).

S2. Experimental

SOCl₂ (10 ml) was added into MeOH (60 ml) in a reaction flask at 273 K and *L*-3,4-dihydroxyphenylalanine (5.0 g, 25 mmol) was gradually added to this mixture. The temperature was increased to room temperature. After 24 h, the solvent was removed in *Vacuo*, to yield a white solid. The solid product was recrystallized from ethyl acetate by slow evaporation in the form of colorless single crystals of the title compound suitable for X-ray analysis.

S3. Refinement

An absolute structure was determined by the Flack (1983) method using 1117 Friedel pairs of reflections which were not merged. The H atoms bonded to N and O-atoms were located from a difference Fourier map and were allowed to refine freely. The H atoms bonded to C-atoms were positioned geometrically and refined using riding mode, with C—H = 0.95, 0.98, 0.99 and 1.00 Å, for aryl, methyl, methylene and methyne H-atoms, respectively; the $U_{iso}(H)$ were allowed at 1.5 $U_{eq}(C \text{ methyl})$ or 1.2 $U_{eq}(C \text{ non-methyl})$.

**Figure 1**

The molecular structure of the title compound with the atom numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are presented as small spheres of arbitrary radius.

Figure 2

A view of the unit cell showing partial packing of the title compound; hydrogen bonds are shown as dotted lines.

 pairs
 Absolute structure parameter: -0.03 (5)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
