Received 30 March 2012; accepted 31 March 2012

Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å;  $R$  factor = 0.042;  $wR$  factor = 0.141; data-to-parameter ratio = 11.7.

The title compound {systematic name: 4-[(*E*)-2-(3,5-dihydroxyphenyl)ethenyl]benzene-1,3-diol dihydrate},  $\text{C}_{14}\text{H}_{12}\text{O}_4 \cdot 2\text{H}_2\text{O}$ , a derivative of resveratrol, was isolated from mulberry. The linking  $\text{C}=\text{C}$  double bond has a *trans* conformation and allows the formation of a conjugated system throughout the molecule. The dihedral angle between the benzene rings is  $9.39$  (9)°. In the crystal, molecules are connected into a three-dimensional architecture through  $\text{O}-\text{H} \cdots \text{O}$  hydrogen bonds between hydroxy groups of oxyresveratrol and solvent water molecules.

## Oxyresveratrol from Mulberry as a dihydrate

Hui Deng, Xixin He, Yujuan Xu and Xiaopeng Hu

### S1. Comment

Oxyresveratrol was firstly isolated from the heartwood of *Artocarpus lakoocha* Roxb as a abundant *trans*-tetrahydroxystilbene (Mongolsuk *et al.*, 1957). Oxyresveratrol is responsible for the anthelmintic activity of the traditional Thailand anthelmintic drug "Puag-Haad" prepared from *A. lakoocha* (Charoenlarp *et al.*, 1989; Charoenlarp *et al.*, 1981). Recent investigations have revealed several interesting bioactivities of oxyresveratrol, such as tyrosinase inhibitory activity (Zheng *et al.*, 2011; Zheng *et al.*, 2010; Kim *et al.*, 2004; Kim *et al.*, 2002; Shin *et al.*, 1998), *in vitro* anti-viral activity (Lipipun *et al.*, 2011; Galindo *et al.*, 2011; Sasivimolphon *et al.*, 2009; Chuanasa *et al.*, 2008; Likhitwitayawuid *et al.*, 2006; Likhitwitayawuid *et al.*, 2005), strong anti-oxidative and anti-inflammatory (Liu *et al.*, 2009; Breuer *et al.*, 2006; Chung *et al.*, 2003), and neuroprotective properties (Chao *et al.*, 2008; Ban *et al.*, 2008; Ban *et al.*, 2006; Breuer *et al.*, 2006; Andrabi *et al.*, 2004). These medicinal properties indicate several areas of therapeutic potential for oxyresveratrol and the compound has been recommended as a drug candidate for the treatment of neurodegenerative disorders (Breuer *et al.*, 2006; Andrabi *et al.*, 2004) and a skin-whitening agent in cosmetic preparations (Likhitwitayawuid, 2008).

Mulberry (*Morus alba L.*) is a medicinal plant in east Asia. Its branch, leaf, ripe fruit and root bark are well known traditional Chinese drugs and contain a large amounts of *trans*-hydroxystilbenes such as mulberroside A, phaponticin, phapontigenin, resveratrol, pterostilbene, piceatannol, piceid, astringin, kuwanon Y, kuwanon Z, oxyresveratrol and its derivatives (Qiu *et al.*, 1996; Hano *et al.*, 1986; Piao *et al.*, 2009). In this paper, we isolated oxyresveratrol from mulberry (*Morus alba L.*) and report the structure of oxyresveratrol dihydrate.

In the title compound (Fig. 1), the benzene rings form a dihedral angle of 9.39 (9)°. The presence of the *trans* C=C double bond allows the formation of a conjugated system, strongly stabilized through  $\pi$ -electron delocalization. The *trans*-double bond is the same as found in similar structures (Piao *et al.*, 2009; Qiu *et al.*, 1996; Hano *et al.*, 1986). The molecules of the oxyresveratrol are connected into a three-dimensional architecture through O—H—O hydrogen bonds formed between its hydroxyl group and the solvent water molecules (Fig. 2 and Table 1).

### S2. Experimental

The dried root bark of *Morus alba L.* (1 kg) was powdered and extracted with 95% ethanol at room temperature for 48 h. After removal of the solvent under reduced pressure, a brown extract was suspended with water, and sequentially partitioned with petroleum ether, acetyl acetate and n-butanol. The acetyl acetate extract (9 g) was subjected to column chromatography on silica gel (200–300 mesh) with increasing concentrations of ethyl acetate in petroleum ether.

Oxyresveratrol was afforded from the fraction (petroleum ether-ethyl acetate 6/4, *v/v*). The title compound was colourless to light-yellow crystal with *M.pt*: 474–476 K. Crystals suitable for X-ray analysis were obtained by slow evaporation from its chloroform–methanol (4/1, *v/v*) solution. <sup>1</sup>H NMR (400 MHz, MeOD)  $\delta$  7.33 (d, *J* = 9.2 Hz, 1H), 7.27 (d, *J* = 16.5 Hz, 1H), 6.82 (d, *J* = 16.4 Hz, 1H), 6.46 (d, *J* = 2.1 Hz, 2H), 6.34 – 6.32 (m, 1H), 6.31 (s, 1H), 6.15 (t, *J* = 2.2 Hz, 1H); O—H not observed.

## S3. Refinement

The hydroxy- and C-bound H-atoms were placed in calculated positions [ $\text{O—H} = 0.84 \text{ \AA}$ ,  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$ ;  $\text{C—H} = 0.95 \text{ \AA}$ ,  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ ] and were included in the refinement in the riding model approximation. The water-H atoms were refined with  $\text{O—H} = 0.90 \pm 0.01 \text{ \AA}$ , and with  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$ . The O6-water molecule was found to be disordered over three positions, one with full weight, the others with 0.5 site occupancy factors.

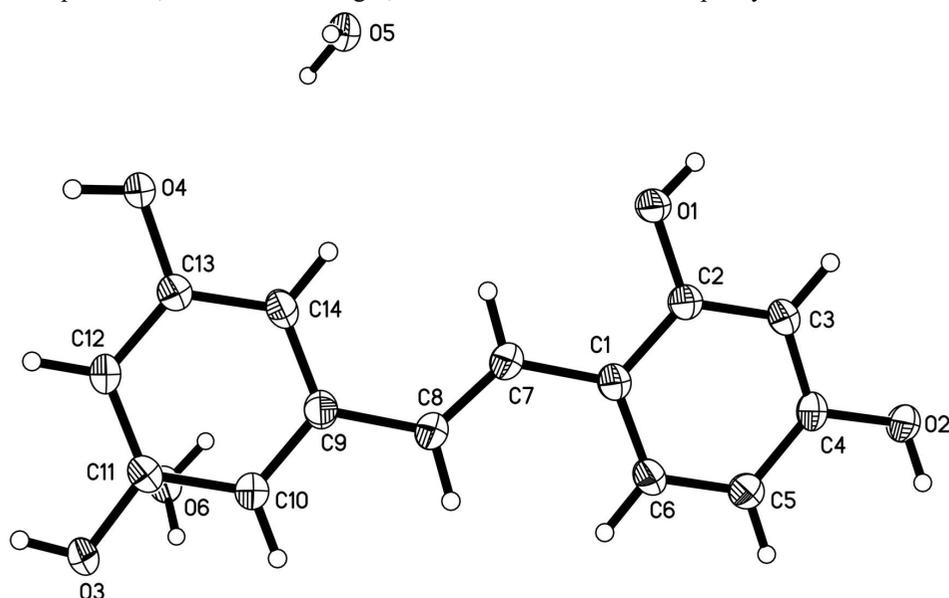

Figure 1

A view of the molecular structure of compound (I). The displacement ellipsoids are at the 50% probability level and H atoms are shown as small spheres of arbitrary radii.

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
