# N-Hexyl-3-(4-hydroxy-3,5-dimethoxyphenyl)propanamide 

L. C. R. Andrade, ${ }^{\text {a }}$ J. A. Paixão, ${ }^{\text {a* }}$ M. J. M. de Almeida, ${ }^{\text {a }}$ E. J. Tavares da Silva ${ }^{\text {b }}$ and F. M. Fernandes Roleira ${ }^{\text {b }}$<br>${ }^{\text {a }}$ CEMDRX, Department of Physics, Faculty of Sciences and Technology, University of Coimbra, P-3004-516 Coimbra, Portugal, and ${ }^{\mathbf{b}}$ Center for Pharmaceutical Studies, Pharmaceutical Chemistry Group, Faculty of Pharmacy, University of Coimbra, P-3000-548 Coimbra, Portugal<br>Correspondence e-mail: jap@pollux.fis.uc.pt<br>Received 20 April 2012; accepted 27 April 2012<br>Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.048 ; w R$ factor $=0.172$; data-to-parameter ratio $=20.9$.

In the title compound, $\mathrm{C}_{17} \mathrm{H}_{27} \mathrm{NO}_{4}$, which is an hydrosinapic acid derivative with increased lipophilicity conferred by an additional alkyl chain, the central and the hexyl linear chains contain slightly shorter bond lengths $[\mathrm{C}-\mathrm{N}=1.316$ (2) $\AA$; average linear chain $\mathrm{C}-\mathrm{C}=1.487$ (6) $\AA$ ] than reported average values $\left[\mathrm{Csp}^{2}-\mathrm{N}=1.334, \mathrm{C}-\mathrm{C}\right.$ for $\mathrm{CH}_{2}-\mathrm{CH}_{2}=1.524$ and $1.513 \AA$ for $\mathrm{CH}_{2}-\mathrm{CH}_{3}$ ]. The 4-hydroxy-3,5-dimethoxyphenyl plane [r.m.s. deviation 0.055 (12) $\AA$ ] makes an angle of $59.89(5)^{\circ}$ with the central plane of the molecule (composed of the N atom, the carbonyl group and the two methylene C atoms linking the carbonyl group and the ring, [r.m.s. deviation 0.0026 (10) $\AA$ ], which, in turn, makes an angle of $64.24(13)^{\circ}$ with the essentially planar hexyl chain [r.m.s. deviation 0.035 (18) $\AA$ ]. The $\mathrm{N}-\mathrm{H}$ group of the amide group is involved in a bifurcated hydrogen bond towards the hydroxy and one of the methoxy O atoms of the 4-hydroxy-3,5dimethoxyphenyl substituent of a neighbouring molecule, forming a two-dimensional network in the (100) plane. In addition, the same hydroxy group acts as a donor towards the carbonyl O atom of another neighbouring molecule, forming chains running along the $b$ axis.

## S1. Comment

Hydroxycinnamic acids and derivatives are known to display relevant antioxidant properties as well as biological activity towards several tumor cells, with their growth-inhibitory potency being strongly dependent on their structural characteristics (Gomes et al., 2003). Despite all the interesting biological effects of hydroxycinnamic acids and despite being dietary components, their bioavailability presents some limitations: although working well in aqueous media, their hydrophilic nature is usually a restriction for lipophilic systems protection (Gao \& Hu, 2010). In order to develop new and more effective phenolic agents suitable for chemopreventive and/or chemotherapeutic purposes, hydrosinapic acid derivatives with increased lipophilicity conferred by an additional alkyl chain, were developed. For this, $N$-hexyl-3-(4-hy-droxy-3,5-dimethoxyphenyl)propanamide was synthesized by reaction of the corresponding acid with hexylamine, in the presence of the coupling agent (benzotriazol-1-yloxy)tris(dimethylamino)phosphonium hexafluorophosphate (BOP) (Roleira et al., 2010). Single crystal X-ray measurements evidence normal bond length values for the phenyl ring and its substituents. However the $\mathrm{C}_{s p}{ }^{2}-\mathrm{N}$ bond length in the molecule's central chain $[1.316(2) \AA$ ] is shorter than the reported average value of $1.334 \AA$ (Allen et al., 1987). Furthermore the average value of the five measured $\mathrm{C}_{s p}{ }^{3}-\mathrm{C}_{s p}{ }^{3}$ bond lengths of the hexyl chain $\left[1.487(6) \AA\right.$ ] is also significantly shorter then the average reported values ( 1.524 for $\mathrm{CH}_{2}-\mathrm{CH}_{2}$ and 1.513 for $\mathrm{CH}_{2}-\mathrm{CH}_{3}$, Allen et al., 1987). The molecule is characterized by an intramolecular $\mathrm{C} 11-\mathrm{H} 11 \mathrm{~A} \cdots \mathrm{O} 9$ pseudohydrogen bond within the central chain plane (deviation $0.0026 \AA$ ). The dihedral angle between this plane and the phenyl one (deviation $0.0545 \AA$ ) is $59.89(5)^{\circ}$, being $64.24(13)^{\circ}$ the corresponding value between the central plane and the one of the hexyl chain (deviation $0.0349 \AA$ ). Cohesion of the structure is obtained through an extended newtork of H-bonds. The H atom of the amide group is involved in a bifurcated H -bond towards the hydroxy and one of the methoxy O atoms of the 4-hydroxy-3,5-dimethoxyphenyl substituent of a neignhbour molecule, forming a two dimensional network in the (100) plane. In addition, the same hydroxy group acts as a donnor towards the carbonyl O atom of another neighbour molecule forming chains running along the $b$ axis.

## S2. Experimental

The title amide was prepared from the 3-(4-hydroxy-3,5-dimethoxyphenyl)propanoic acid by dissolution of 5 mmol of the acid in 10 ml of DMF followed by the addition of triethylamine $(0.7 \mathrm{ml}, 5 \mathrm{mmol})$. The solution was cooled in an icewater bath and $0.657 \mathrm{ml}(5 \mathrm{mmol})$ of $N$-hexylamine were added followed by a solution of $2.21 \mathrm{~g}(5 \mathrm{mmol})$ of BOP in 10 ml of methylene chloride. The mixture was stirred at 273 K for 30 min and then at room temperature for 30 min. Methylene chloride was removed under reduced pressure and the solution was diluted with 150 ml of water and extracted with ethyl acetate ( 150 ml ). The organic phase was washed successively with 1 N hydrochloride acid ( $3 \times 100 \mathrm{ml}$ ), water ( 150 $\mathrm{ml}), 1 \mathrm{M} \mathrm{NaHCO} 3(3 \times 100 \mathrm{ml})$, and water $(2 \times 100 \mathrm{ml})$, dried over anhydrous magnesium sulfate, filtered and evaporated, affording a crude material which was purified by crystallization yielding the desired amide. Suitable crystals for X-ray
analysis were grown from slow evaporation of ethyl acetate. Mp(ethyl acetate): 366-367 K; IR (ATR) $v_{\max } \mathrm{cm}^{-1}: 3319(\mathrm{~N}$ -H stretch), 1643 ( $\mathrm{C}=\mathrm{O}$ ), 1125 ( $\mathrm{C}-\mathrm{O}$ ).

## S3. Refinement

All hydrogen atoms were placed at idealized positions and refined as riding on their parent atoms using SHELXL97 defaults; the hydroxyl H atom was initialy positioned at the maximum of the difference electronic density around the parent O atom and refined using the HFIX 147 instruction.
Only 4255 out of 4259 independent reflections were used in the refinement because 4 low angle reflections were omitted due to overshadowing from the beam-stop.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
