Received 21 May 2012; accepted 27 May 2012
Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.001 \AA$; $R$ factor $=0.039 ; w R$ factor $=0.124 ;$ data-to-parameter ratio $=36.3$.

The title compound, $\mathrm{C}_{10} \mathrm{H}_{10} \mathrm{NO}_{2}^{+} \cdot \mathrm{Cl}^{-}$, contains a quinoline ring system which is essentially planar, with the largest deviation from the mean plane being 0.017 (1) $\AA$. In the crystal, the ion pairs and their inversion-symmetry-related partners are linked by $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds to form tetramers which are further connected through $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, building infinite one-dimensional chains parallel to the [010] direction.

## S1. Comment

8-Quinolinol is a strong iron chelator with antioxidant property (Kayyali et al. 1998). 5-Chloromethyl-8-hydroxyquinoline hydrochloride (I) is used as an intermediate in the synthesis of 5-hydroxymethyl-8-quinolinol and some substituted 8-quinolinol derivatives (Mishra et al. (2004). The corresponding aluminium complexes has been used as an excellent Organic Light-Emitting Diodes (OLEDs) (Tang et al. (1989), Chen \& Shi (1998), Shougen et al. (2000)) witch are currently under intensive investigation for application as a promising display technology due to their high luminous efficiency and capability of emitting full colour flat displays (Cao et al. (1996), Wu et al. (2003)). The present work describes the crystal structure of $\mathrm{C}_{10} \mathrm{H}_{10} \mathrm{NO}_{2} . \mathrm{Cl}$ (scheme 1) obtained from the X-ray diffraction data on single-crystal.
The 5-(hydroxymethyl)-8-quinolinol hydrochloride molecule structure is built up from two fused six-membered rings linked to $\mathrm{CH}_{2} \mathrm{OH}$ and to OH groups as shown in Fg .1. The fused-ring system is essentially planar, with the maximum deviation of 0.017 (1) $\AA$ from C 7 atom. The dihedral angle between them does not exceed $1.15(5)^{\circ}$. The hydroxide $\mathrm{O} 2-$ H linked to $-\mathrm{C}_{10 \mathrm{H}}^{2}-$ form an angle of $56.68(6)^{\circ}$ with the mean plane of the quinolin ring. In the crystal, each molecule and its symmetry through the inversion center are linked by $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds in the way to form dimers as shown in Fig.2. These dimers are further connected through $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds building infinite onedimensional chains parallel to $\left[\begin{array}{lll}0 & 1 & 0\end{array}\right]$ direction (Table 1).

## S2. Experimental

5-Chloromethyl-8-hydroxyquinoline hydrochloride (I) was synthesized according to the method described by Zheng et al. (2005). A mixture of $10.0 \mathrm{~g}(0.068 \mathrm{~mol})$ of 8 -hydroxyquinoline, 11 ml of concentrated hydrochloric acid, and 11 ml $(0.397 \mathrm{~mol})$ of $37 \%$ formaldehyde was treated with hydrogen chloride gas and stirred for 6 h . The solution was allowed to stand at room temperature for 2 h without stirring. The yellow solid obtained was collected on a filter, washed with acetone or alcohol, and dried under vacuum to give 5-chloromethyl-8-hydroxyquinoline hydrochloride (I) ( $13.0 \mathrm{~g}, 98 \%$ ). The compound obtained was dissolved in distilled water in a box Petrys and let in air at room temperature. After 10 days, transparent single crystals as platelets were isolated. X-ray diffraction analysis shows that the obtained product is the 5-(hydroxymethyl)-8-quinolinol hydrochloride.

## S3. Refinement

H atoms were located in a difference map and treated as riding with $\mathrm{N}-\mathrm{H}=0.86 \AA, \mathrm{C}-\mathrm{H}=0.93 \AA$ (aromatic), $\mathrm{C}-\mathrm{H}=$ $0.97 \AA$ (methylene) and $\mathrm{O}-\mathrm{H}=0.82 \AA$ with $U_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\mathrm{eq}}$ (aromatic, methylene) and $U_{\mathrm{iso}}(\mathrm{H})=1.5 U_{\mathrm{eq}}(\mathrm{OH})$.

Figure 1
Molecular structure of the title compound with the atom-labelling scheme. Displacement ellipsoids are drawn at the 50\% probability level. H atoms are represented as small circles.

Figure 2
Molecule and its symmetry through the inversion center linked by hydrogen bonds and building dimers.

## Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against all reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on all data will be even larger.
