Correspondence e-mail: edward.tiekink@gmail.com
Received 9 June 2012; accepted 14 June 2012
Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.052 ; w R$ factor $=0.158$; data-to-parameter ratio $=12.7$.

In the title compound, $\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{~N}_{3}$, the 12 non- H atoms are essentially planar (r.m.s. deviation $=0.068 \AA$ ). The maximum deviation from planarity is reflected in the torsion angle between the $\beta-\mathrm{N}$ atom of the hydrazinyl residue and the quinolinyl N atom $\left[\mathrm{N}-\mathrm{N}-\mathrm{C}-\mathrm{N}=-12.7\right.$ (3) ${ }^{\circ}$ ]; these atoms are syn. In the crystal, supramolecular layers in the $b c$ plane are formed via $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds.

## 2-Hydrazinylquinoline

Muhd. Hidayat bin Najib, Ai Ling Tan, David J. Young, Seik Weng Ng and Edward R. T. Tiekink

## S1. Comment

Hydrazones are versatile nitrogen donor ligands which have been used extensively for making coordination complexes for a variety of applications from organic light emitting diode (OLED) materials (Zhang et al., 2011) to supramolecular magnetic clusters (Petukhov et al., 2009). These ligands are made by condensation of a carbonyl compound with an organic hydrazine or hydrazide (Anwar et al., 2011). We have previously reported the solid-state structure of the zinc(II) complex of 3,5-dimethyl-1- (2'-quinolyl)pyrazole (Najib et al., 2012). The ligand in that complex was made by the condensation of acetylacetone with the title compound (Gupta et al., 2007). Herein, the crystal and molecular structure of the title compound is described.
In the title compound, Fig. 1, the 12 non-hydrogen atoms are planar with a r.m.s. deviation $=0.068 \AA$ and maximum deviations of 0.068 (2) and -0.152 (2) $\AA$ for the N1 and N3 atoms, respectively. The amine-N3 group is syn with the quinolinyl-N1 atom with the $\mathrm{N} 3-\mathrm{N} 2-\mathrm{C} 1-\mathrm{N} 1$ torsion angle being -12.7 (3) ${ }^{\circ}$.
In the crystal, molecules assemble into supramolecular layers in the bc plane via $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds, Fig. 2 and Table 1. The secondary amine-H hydrogen bonds to the primary amine-N2 atom. One of the primary amine-H atoms forms a hydrogen bond with the quinolinyl-N atom and the other forms a weak interaction with the secondary amine-N2 atom. The layers stack along the $a$ axis with no specific interactions between them, Fig. 3.

## S2. Experimental

The title compound was prepared by modification of a literature procedure (Gupta et al., 2007). 2-Chloroquinoline (10.06 g) and hydrazine monohydrate $\left(64-65 \% \mathrm{~N}_{2} \mathrm{H}_{4}\right)$ in water $(10 \mathrm{ml})$ were refluxed for 2 h . The water was removed using a rotary evaporator to provide a scarlet residue which was triturated with water and filtered. This scarlet solid was recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and hexane to provide $6.48 \mathrm{~g}(66.6 \%)$ of the title compound [M.p. $=417 \mathrm{~K}$ ]. Spectroscopic data for the title compound are given in the archived CIF.

## S3. Refinement

C-bound H -atoms were placed in calculated positions $\left[\mathrm{C}-\mathrm{H}=0.95 \AA, U_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C})\right]$ and were included in the refinement in the riding model approximation. The N -bound H -atoms were located in a difference Fourier map and refined freely.

## supporting information

Figure 1
The molecular structure of the title molecule showing the atom-labelling scheme. The displacement ellipsoids are drawn at the $50 \%$ probability level.

Figure 2
A view of the supramolecular layer in the $b c$ plane in the crystal of the title compound. The $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds are shown as blue dashed lines (see Table 1 for details).

Figure 3
A view of the unit-cell contents of the title compound in projection down the $b$ axis. The $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds are shown as blue dashed lines (see Table 1 for details).

Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}^{2}\right)+(0.1 P)^{2}\right]$ where $P=\left(F_{0}^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\max }<0.001$
$\Delta \rho_{\text {max }}=0.32 \mathrm{e}_{\AA^{-3}}$
$\Delta \rho_{\text {min }}=-0.23$ e $\AA^{-3}$

## Special details

Experimental. Spectroscopic data for the title compound: IR $\backslash \mathrm{V} / \mathrm{cm}^{-1}: 3282,3188,3042,2954,2926,2854,1621,1529$,
 $(1 \mathrm{H}, \mathrm{dd}), 7.23(1 \mathrm{H}, \mathrm{dd}), 6.75(1 \mathrm{H}, \mathrm{d}), 4.0\left(3 \mathrm{H}, \mathrm{br}\right.$ s). ${ }^{13} \mathrm{C}$ NMR $100 \mathrm{MHz}\left(\mathrm{CDCl}_{3}\right) \delta: 158.8,147.3,137.4,129.7,127.5$, 126.3, 124.2, 122.8, 110.6.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
