Key indicators: single-crystal X-ray study; $T = 173\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.041; wR factor = 0.115; data-to-parameter ratio = 16.5.

In the title compound, $\text{C}_{17}\text{H}_{13}\text{FO}_3$, the dihedral angle between the benzene rings is $70.34(5)^\circ$. In the crystal, molecules are linked via pairs of bifurcated $\text{C}-\text{H}\cdots(\text{O},\text{O})$ hydrogen bonds, forming inversion dimers. These dimers are linked via $\text{C}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{F}$ interactions, forming a three-dimensional structure.

2-Acetylphenyl (2E)-3-(4-fluorophenyl)acrylate

S1. Comment

The title compound (*E*)-2-acetylphenyl-3-(4-fluorophenyl) acrylate was obtained as an intermediate en route to the synthesis of 4'-fluoro-2-styrylchromone and easily converts to the 2-hydroxyphenyl pentadienone with DMSO in the presence of a strong base (Santos *et al.*, 2009). It was synthesized according to the procedure by Pinto *et al.* (2000) with modification. The title compound is a core structure in various natural and pharmaceutically active compounds, displaying a broad spectrum of activity (Gomes *et al.*, 2010).

In the molecule of the title compound (Fig. 1), the two aromatic rings (ring 1: C3—C4—C5—C6—C7—C8; ring 2: C12—C13—C14—C15—C16—C17—C18) are almost perpendicular to each other with a dihedral angle of 70.34 (5)°. The torsion angle C9—C10—C11—C12 is -178.8 (1)°, indicating a *trans* configuration of the double bond. All bond lengths and angles are within normal ranges (Allen *et al.*, 1987). In the crystal packing, ring 1 adopts a parallel offset arrangement with itself of the neighbouring molecule with centroidal distance of 4.125 (1) Å. The crystal is further stabilized by a number of weak hydrogen bonds with the type C—H···X (*X* = O or F) and C—H···π (Table 1).

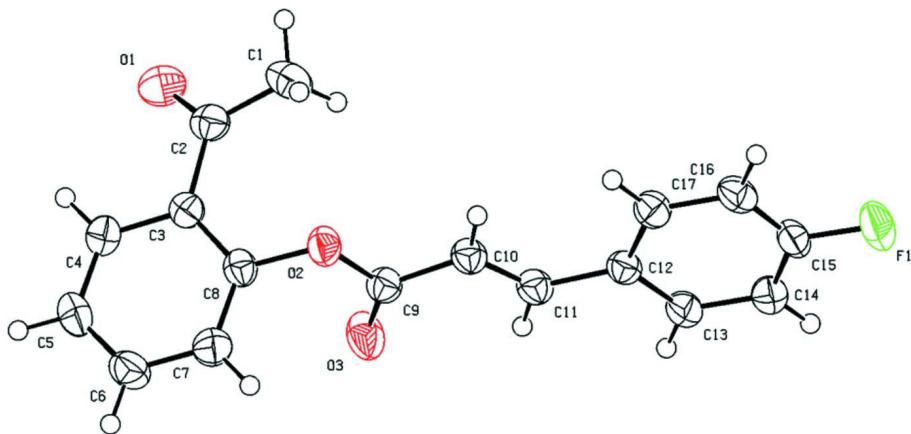

S2. Experimental

Phosphorous oxychloride (15.6 mmol) was added to a solution of 2-hydroxyacetophenone (12.0 mmol) and 4'-fluoro cinnamic acid (15.6 mmol) in dry pyridine. The solution was stirred at 60–70 °C for 3 h, then poured into ice and water and the reaction mixture acidified with hydrochloric acid (pH 3–4). The obtained solid was removed by filtration and dissolved in ethyl acetate (100 ml) and purified by silica gel column chromatography using a 7:3 mixture of ethyl acetate:n-hexane as the eluent. The solvent was evaporated to dryness and the residue recrystallized from ethanol, resulting in the title compound with a 72% yield and a m.p of 80–82°C.

S3. Refinement

All non-hydrogen atoms were refined anisotropically. All hydrogen atoms could be found in the difference electron density maps but were finally placed in idealized positions refining in riding models with *U*_{iso} set at 1.2 or 1.5 times *U*_{eq} of their parent atoms.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (\AA , $^\circ$)

Cg1 is the centroid of the C3–C8 ring.
