## 4-Cyanoanilinium bromide

David J. Vumbaco, ${ }^{\text {a }}$ Michael N. Kammer, ${ }^{\text {b }}$ Lynn V. Koplitz $^{\text {c }}$ and Joel T. Mague ${ }^{\text {d } *}$

${ }^{\text {a }}$ Department of Biological Sciences, Loyola University, New Orleans, LA 70118, USA, ${ }^{\mathbf{b}}$ Department of Physics, Loyola University, New Orleans, LA 70118, USA, ${ }^{\text {c }}$ Department of Chemistry, Loyola University, New Orleans, LA 70118, USA, and ${ }^{\mathbf{d}}$ Department of Chemistry, Tulane University, New Orleans, LA 70118, USA Correspondence e-mail: joelt@tulane.edu

Received 12 July 2012; accepted 27 August 2012
Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.020 ; w R$ factor $=0.051$; data-to-parameter ratio $=20.6$.

In the crystal structure of the title compound, $\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{~N}_{2}{ }^{+} \cdot \mathrm{Br}^{-}$, the cations are associated into inversion dimers through weak pairwise $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds. The dimers further form stepped sheets via weak pairwise $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds. In the sheets, the spacing between the mean planes of the laterally displaced aromatic rings in adjacent dimers is 1.124 (6) A. Three $\mathrm{N}-\mathrm{H} \cdots \mathrm{Br}$ interactions and two weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{Br}$ interactions per cation tie the sheets together.

## S1. Comment

In the title compound, $\left[\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{~N}_{2}\right]^{+} \mathrm{Br}^{-}$, the cations are associated into dimers through weak, pairwise $\mathrm{C} 3-\mathrm{H} 3 \cdots \mathrm{~N} 2$ intermolecular interactions (Fig. 1). The dimers further form stepped sheets via weak, pairwise C5-H5 $\cdots \mathrm{N} 2$ intermolecular interactions. In these sheets the spacing between the mean planes of the aromatic rings in adjacent dimers is 1.124 (6) $\AA$ (Table 1). The three hydrogen atoms of the anilinium group make contacts with the surrounding anions of 2.47-2.54 $\AA$. These distances compare well with the mean value of 2.49 (2) $\AA$ for an $\mathrm{N}^{+}-\mathrm{H}^{\cdots} \mathrm{Br}^{-}$hydrogen bond (Steiner, 1998) and serve, together with weak $\mathrm{C} 2-\mathrm{H} 2 \cdots \mathrm{Br} 1$ and $\mathrm{C} 6-\mathrm{H} 6 \cdots \mathrm{Br} 1$ interactions, to tie the stepped sheets into a layer structure (Fig. 2) with the layers 3.493 (7) $\AA$ apart and forming rectangular channels of width ca $12.8 \AA$ (Fig. 3).

## S2. Experimental

0.55 g of 4-cyanoaniline and 2.5 ml of aquous hydrobromic acid ( 2 M ) were combined in 10 ml of ethanol. This solution was slowly evaporated to dryness under ambient conditions to form crystals of the title compound.

## S3. Refinement

H -atoms attached to C were placed in calculated positions $(\mathrm{C}-\mathrm{H}=0.95-0.98 \AA$ ) while those attached to N were placed in sites determined from a difference map and their coordinates adjusted to give $\mathrm{N}-\mathrm{H}=0.88 \AA$. All H -atoms were included as riding contributions with isotropic displacement parameters 1.2 times those of the attached atoms.

Figure 1
Perspective view of the asymmetric unit with displacement ellipsoids drawn at the $50 \%$ probability level

Figure 2
Packing showing the stepped layer structure. $\mathrm{N}-\mathrm{H} \cdots \mathrm{Br}, \mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{Br}$ interactions are shown as dashed lines. Color key: $\mathrm{C}=$ gray, $\mathrm{H}=$ orange, $\mathrm{Br}=$ red, $\mathrm{N}=$ blue.

Figure 3
Packing showing the rectangular channels. $\mathrm{N}-\mathrm{H} \cdots \mathrm{Br}, \mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{Br}$ interactions are shown as dashed lines. Color key: $\mathrm{C}=$ gray, $\mathrm{H}=$ orange, $\mathrm{Br}=$ red, $\mathrm{N}=$ blue.

> $k=-8 \rightarrow 8$
> $l=-19 \rightarrow 19$

Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H -atom parameters constrained
$w=1 /\left[\sigma^{2}\left(F_{0}^{2}\right)+(0.0248 P)^{2}+0.1891 P\right]$
where $P=\left(F_{0}^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}=0.002$
$\Delta \rho_{\text {max }}=0.86$ e $\AA^{-3}$
$\Delta \rho_{\min }=-0.41 \mathrm{e}^{-3}$

## Special details

Experimental. The diffraction data were obtained from 3 sets of 400 frames, each of width $0.5^{\circ}$. in omega, collected at phi $=0.00,90.00$ and $180.00^{\circ}$. and 2 sets of 800 frames, each of width $0.45^{\circ}$ in phi, collected at omega $=-30.00$ and $210.00^{\circ}$. The scan time was $10 \mathrm{sec} /$ frame.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger. H-atoms attached to carbon were placed in calculated positions ( $\mathrm{C}-\mathrm{H}=0.95 \AA$ ) while those attached to nitrogen were placed in locations derived from a difference map and then their coordinates adjusted to give an $\mathrm{N} — \mathrm{H}$ distance of $0.88 \AA$. All were included as riding contributions with isotropic displacement parameters 1.2 times those of the attached atoms.
