Received 8 August 2012; accepted 29 August 2012

Key indicators: single-crystal X-ray study;  $T = 300\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.038;  $wR$  factor = 0.100; data-to-parameter ratio = 11.3.

The asymmetric unit of the title compound,  $C_{30}H_{27}F_2N_3O_2$ , contains two independent molecules. The pyrrolidine five-membered ring assumes an envelope conformation (with the  $\text{CH}_2$  atom at the flap) in one molecule and a twisted conformation in the other one. In both independent molecules, the 4-piperidinone rings adopt a similar twisted chair conformation. In the crystal, the two independent molecules form an  $R_2^2(8)$  dimer through a pair of  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds; the  $R_2^2(8)$  dimers are connected via weak  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds, leading to a chain extending along the  $c$  axis.

### S1. Comment

The title compound may be regarded as a 'heterosystem' comprising of three distinct classes of heterocycles *viz.* oxindole, piperidine and pyrrolo ring systems each of which exhibits unique pharmacological properties. Compounds with an indole framework are reported to be promising pharmacophores (Hilton *et al.*, 2000) in addition to their antimicrobial and antitumor activities (Sundberg, 1996). Derivatives of 2,3-dihydro-2,3-dioxindole were reported as antibacterial (Mogilaiah & Rao, 1998), antifungal & antiviral (Hansch & Leo, 1979), antioxidant & cytotoxic agents (Taft, 1956). Piperidin-4-ones are reported to possess analgesic, anti-inflammatory, anti-cancer, anti-microbial activities and herbicidal properties (Mobio *et al.*, 1989; Dimmock *et al.*, 2001; Perumal *et al.*, 2001) and act as potential inhibitors of human placental aromatase *in vitro* (Baroudi *et al.*, 1996). Similarly, the pyrrolidine compounds have been reported to be potential inhibitors of diabetes, cancer and infection causing pathogens (Watson *et al.*, 2001). The present structural characterization using single-crystal X-ray intensity data was carried out with a view to understand drug design mechanisms and explore the possibility of discovery of a 'unidrug' with 'multiactivity' properties.

The title compound,  $C_{33}H_{27}N_3O_2F_2$  (I), crystallizes in the space group  $Cc$  with two molecules in the asymmetric unit. The two crystallographically independent molecules in the asymmetric unit differ significantly in their conformation as shown in the overlay diagram (Fig. 2). Compound (I) is a di-spiro ring compound in which the spiro junction links the methyl piperidinone, the oxindole and methyl pyrrolidine rings. The conformation of the 5-membered methyl substituted pyrrolidine ring ( $N1—C2—C3—C4—C5$ ) is envelope on  $C5A$  in molecule A and a twisted envelop about  $C5B$  and  $N1B$  in molecule B (Cremer & Pople, 1975). The corresponding puckering parameters of the pyrrolidine ring for molecules A and B are  $Q = 0.435$  (2) Å,  $\varphi = 152.3$  (3)° and  $Q = 0.411$  (3) Å,  $\varphi = 338.3$  (4)°, respectively. The piperidinone ring ( $N3—C13—C3—C16—C15—C14$ ) adopts a slightly twisted chair conformation in both molecules with the puckering parameters of  $Q = 0.541$  (2) Å,  $\theta = 27.8$  (2)° and  $\varphi = 42.2$  (5)° in molecule A,  $Q = 0.537$  (2) Å,  $\theta = 33.9$  (2)° and  $\varphi = 47.2$  (5)° in molecule B, respectively. The twist of the 4-fluorophenyl with respect to the spiro junction denoted by the torsion  $C3—C4—C25—C30$  differs by about 10° in molecules A and B and that of the 4-fluorobenzylidene by about 20°.

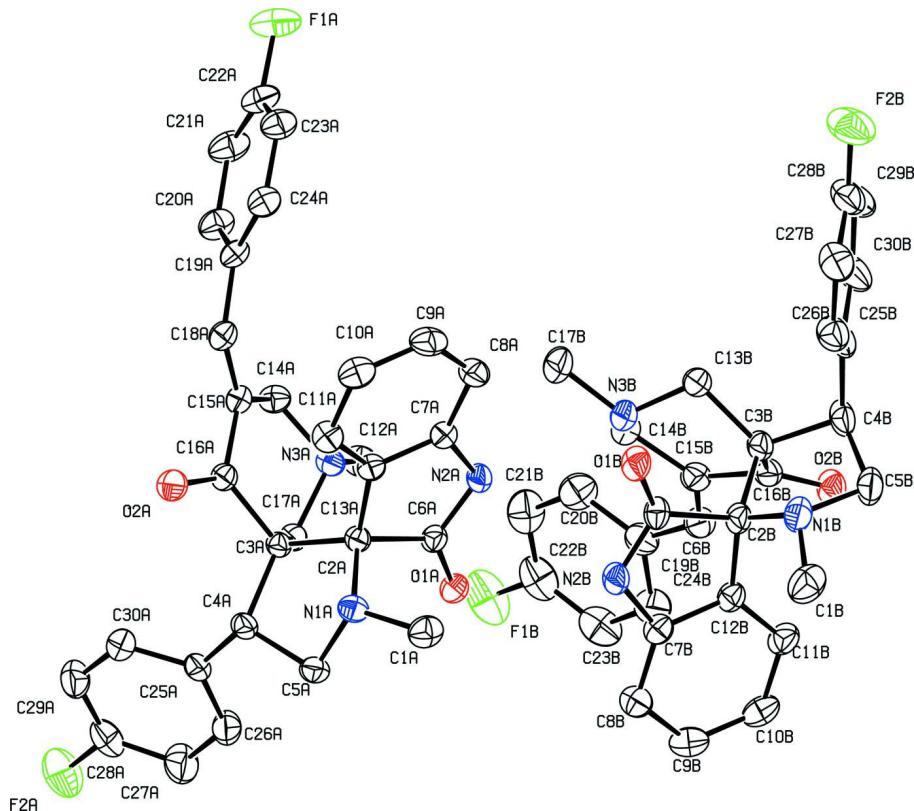

The two crystallographically independent molecules in the asymmetric unit form an asymmetric  $R^2_2(8)$  (Bernstein *et al.*, 1995) dimer through strong  $N—H\cdots O$  hydrogen bonds ( $N2A—H2A\cdots O1B$  and  $N2B—H2B\cdots O1A$ ) in which the N and carbonyl O1 of the pyrrolidine participates as donor and acceptor, respectively (Table 1). The carbonyl O2 of molecule B participates in a  $C—H\cdots O$  hydrogen bond [ $C27B—H27B\cdots O2B$  ( $x, -y, z + 1/2$ )] which connects the  $R^2_2(8)$  dimers along the c-axis (Fig. 3). These chains together with the C-centering of the lattice leads to packing of molecules as shown in Fig. 4. Also, a potential solvent accessible void of volume  $72.4\text{ \AA}^3$  which constitutes about 1.5% of the total unit cell volume is present.

**S2. Experimental**

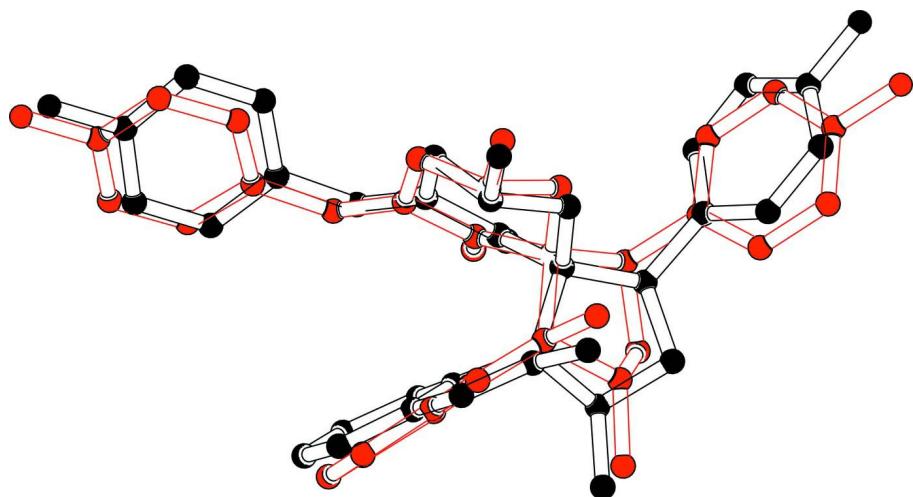

A mixture of 1-methyl-3,5-bis[(*E*)-(4-fluorophenyl)methylidene]tetrahydro-*4*(1*H*)-pyridinone (1 mmol), isatin (1 mmol) and sarcosine were dissolved in methanol (10 mL) and refluxed for 30 min. After completion of the reaction as evident from TLC, the mixture was poured into water (50 mL). The precipitated solid was filtered, washed with water and recrystallized from ethyl acetate to obtain pure 5-(4-fluorobenzylidene)-4'-(4-fluorophenyl)-1,1'-dimethyldispiro-[piperidine-3,3'-pyrrolidine-2',3"-indoline]-4,2"-dione

**S3. Refinement**

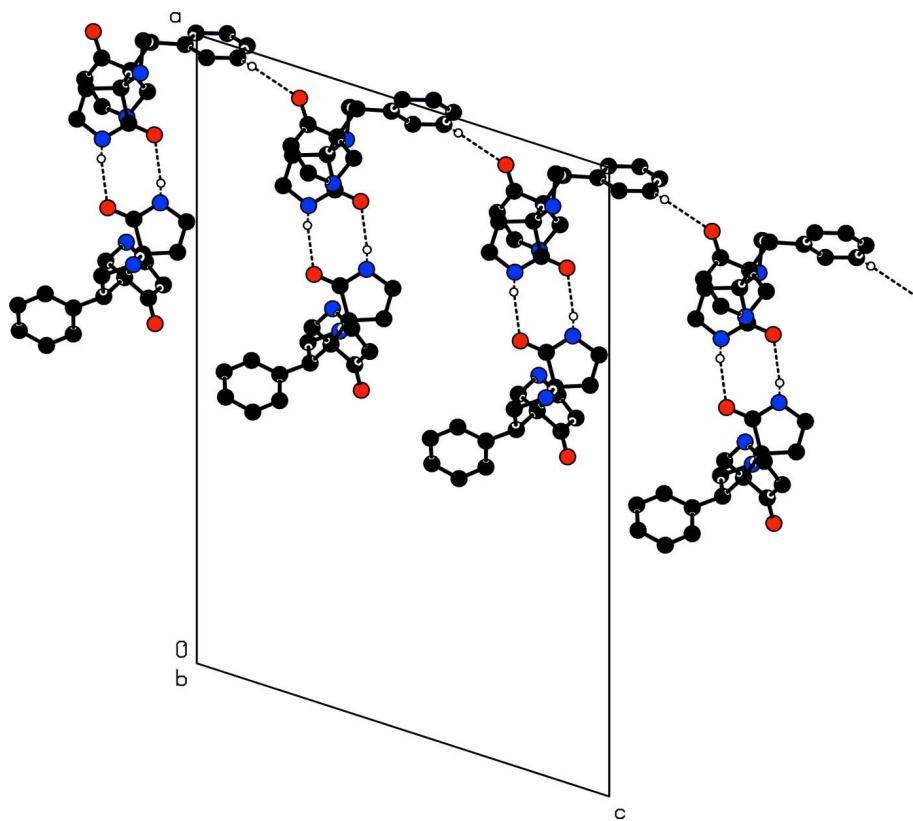

H atoms bonded to N were located in a difference map and refined isotropically. Other H atoms were positioned geometrically and refined using a riding model, with C—H = 0.95–0.99 Å and with  $U_{\text{iso}}(\text{H})$  = 1.2 (1.5 for methyl groups) times  $U_{\text{eq}}(\text{C})$ .

**Figure 1**

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
