Received 20 December 2012; accepted 26 December 2012

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.001\text{ \AA}$; R factor = 0.034; wR factor = 0.079; data-to-parameter ratio = 65.3.

In the title compound, $\text{C}_{16}\text{H}_{22}\text{Cl}_2\text{N}_2\text{O}_2$, the substituted piperidine ring adopts a chair conformation with both substituents in equatorial positions. In the crystal, $\text{N}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds connect molecules into ribbons along the a -axis direction.

tert-Butyl 4-(3,4-dichloroanilino)piperidine-1-carboxylate

Mehr-un-Nisa, Munawar Ali Munawar, Gabriel B. Hall, Sue A. Roberts and Victor J. Hruby

S1. Comment

Piperazine derivatives have been shown to inhibit re-uptake of the monoamines dopamine, noradrenaline and serotonin in synaptosomes (Joergen *et al.*, 1997), and their use for the treatment of protozoal infections, particularly malaria, has also been reported (Hamed *et al.*, 2012). Selective serotonin reuptake inhibitors (SSRI) provide efficacy in the treatment of numerous CNS disorders, including depression and panic disorders, and are usually observed to be effective, well tolerated and simply administered (Peter *et al.*, 2009)). During our search to find new synthetic novel multivalent ligands for the treatment of pain and depression, the title compound was synthesized as an intermediate. Compounds prepared from this intermediate are now under study for possible opioid and SSRIs activities.

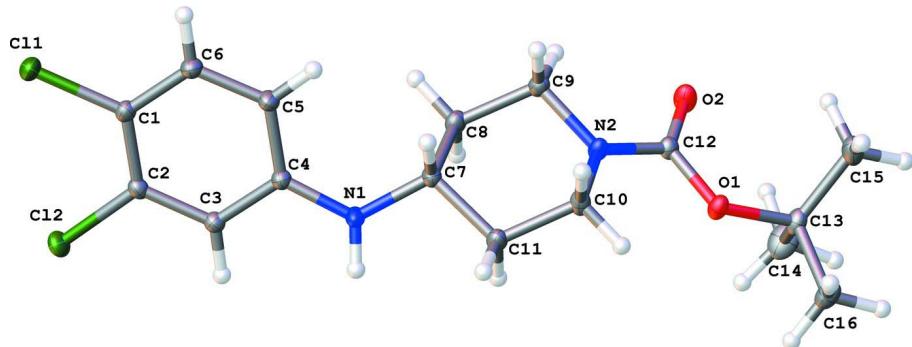

The piperidine ring is in a chair conformation with both substituents in equatorial positions. An intermolecular hydrogen bond is present between N1—H1 and O2 with a donor-hydrogen-acceptor angle of 163.40° and a donor-acceptor distance of 2.9740 (8) Å. Hydrogen bonds connect molecules into ribbons extending in the crystallographic *a* direction. The hydrogen bonding graph set is C1,1(8)a.

S2. Experimental

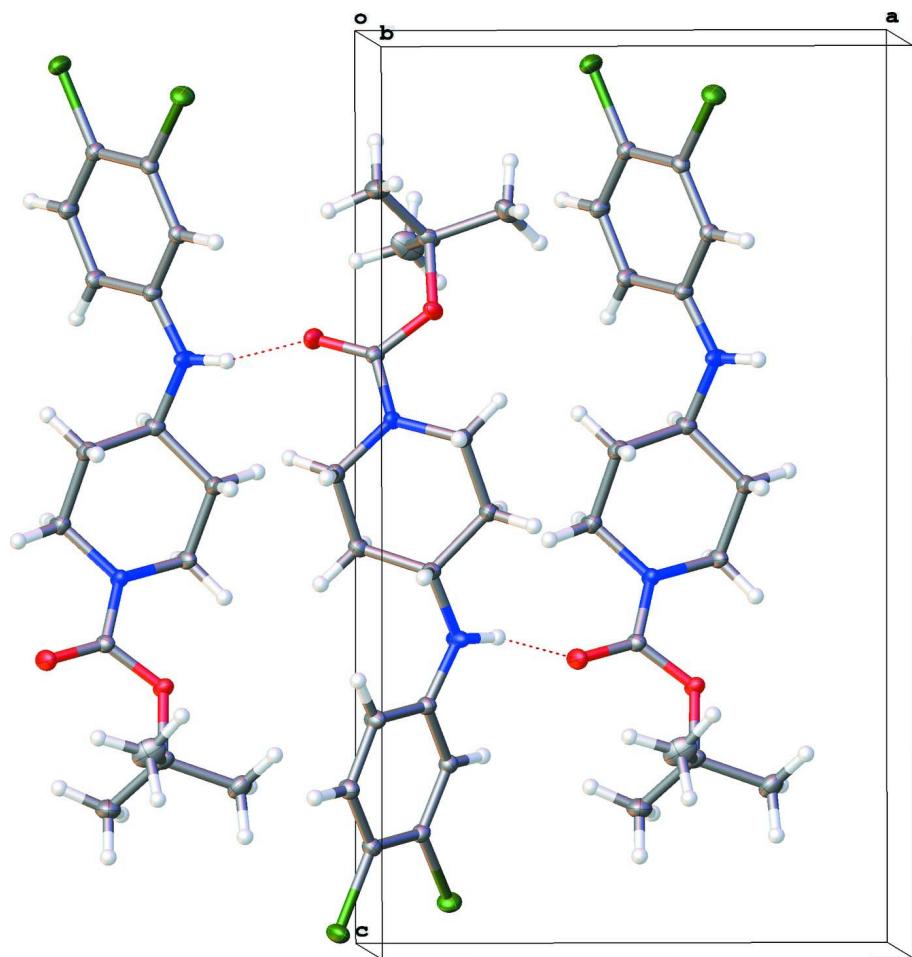

tert-Butyl 4-((3,4-dichlorophenyl)amino)piperidine-1-carboxylate (**1**) was synthesized by modification of a reported method (Vardanyan *et al.*, 2009) by refluxing N-Boc-4-piperidone (5.0 g, 25.1 mmol) and 3,4-dichloroaniline (4.07 g, 25.1 mmol) in toluene (100 ml) with a catalytic amount of *p*-toluene sulphonic acid using a Dean and Stark apparatus for 4–5 h. The reaction was left to cool overnight. Toluene was evaporated under reduced pressure. The crude product was dissolved in diethyl ether, passed through a bed of neutral alumina, and the ether evaporated under reduced pressure. The residue was dissolved in CH₃OH (50 ml) and NaBH₄ (1.05 g, 27.6 mmol) was added slowly at room temperature. The reaction mixture was left to stir overnight. The reaction was quenched with aqueous NaHCO₃ (5 ml). The solvent was removed under reduced pressure and the residue was dissolved in diethyl ether, dried over anhydrous MgSO₄, filtered and evaporated under reduced pressure. The residue was recrystallized from CH₃OH to obtain (**1**) as a white crystalline solid. Crystals appropriate for X-ray diffraction were grown from methanol by slow evaporation at room temperature. 8.22 g (95%) yield; m.p. 155–157 °C; MS (ESI): *m/z*: [M+H]⁺: 345; HRMS: Calcd for C₁₆H₂₃Cl₂N₂O₂: 345.113; found: 345.1131.

S3. Refinement

All hydrogen atoms were visible in a difference Fourier map and were added at calculated positions. Bond distances are set to 0.95 Å for carbon-hydrogen bonds, and 0.88 Å for nitrogen-hydrogen bonds. Thermal parameters for hydrogen atoms were set to 1.2 times the isotropic equivalent thermal parameter of the atom to which the hydrogen atom is bonded.

**Figure 1**

The molecular structure of the title compound. Anisotropically refined atoms are shown as 50% probability ellipsoids.

**Figure 2**

Hydrogen bonding interactions, shown as dashed lines. The molecules are connected into a chain running along the *a* direction in the crystal.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
