 Key indicators: single-crystal X-ray study; $T = 223$ K; mean $\sigma(C-C) = 0.002$ Å;
 R factor = 0.029; wR factor = 0.078; data-to-parameter ratio = 16.1.

In the title compound, $[Co_2(SO_4)_2(C_{10}H_8N_2)_2(C_2H_6O_2)_2 \cdot (H_2O)_2]_n$, there are two crystallographically independent Co^{II} ions, each of which lies on a twofold rotation axis and has a slightly distorted octahedral environment. One Co^{II} ion is coordinated by two N atoms from two bridging 4,4'-bipyridine (4,4'-bipy) ligands, two O atoms from two sulfate ions and two O atoms from aqua ligands. The second Co^{II} ion is similar but with ethane-1,2-diol ligands in place of water molecules. The sulfate anions act as bridging ligands to link two adjacent Co^{II} ions together, leading to the formation of linear $\cdots Co1Co2Co1Co2 \cdots$ chains along the a axis. Adjacent chains are further bridged by 4,4'-bipy ligands, which are also located on the twofold rotation axis, resulting in a two-dimensional layered polymer extending parallel to (001). In the crystal, the layers are linked by extensive $O-H \cdots O$ hydrogen-bonding interactions involving the O atoms of the water molecules and ethane-1,2-diol molecules, resulting in a three-dimensional supramolecular network.

S1. Comment

In past decades, the design and synthesis of metal-organic coordination polymers with transition metals have attracted much attention because of their interesting topologies and potential applications in the areas of materials chemistry (Cui *et al.*, 2002; Sarma *et al.*, 2009; Zhang *et al.*, 2010). It is well known that 4,4'-bipyridine (4,4'-bipy) has been widely applied as an auxiliary bridging ligand to construct novel one-, two- and three-dimensional polymers (Tong & Chen, 2000; Croitor *et al.*, 2011). Some interesting cobalt-(4,4'-bipy) coordination polymers have been synthesized and characterized including $\text{Co}(\text{SO}_4)(\text{C}_{10}\text{H}_8\text{N}_2)(\text{H}_2\text{O})_3 \cdot 2\text{C}_2\text{H}_6\text{O}_2$ (Lu *et al.*, 2006), $[\text{Co}_2(\text{H}_2\text{O})_2(\text{OH})_2(4,4'\text{-bipy})_8](\text{NO}_3)_2 \cdot 2(4,4'\text{-bipy}) \cdot 10\text{H}_2\text{O}$ (Luachan *et al.*, 2007), $[\text{Co}_2(4,4'\text{-bipyridine})_2(\text{SO}_4)_2(\text{H}_2\text{O})_6] \cdot 4\text{H}_2\text{O}$ (Prior *et al.*, 2011), $\text{Co}(\text{SO}_4)(\text{H}_2\text{O})_3(4,4'\text{-bipy}) \cdot 2\text{H}_2\text{O}$ and $\text{Co}(\text{Cl})_2(\text{DMSO})_2(4,4'\text{-bipy})$ (Lu *et al.*, 1998) and $\{[\text{Co}(\text{H}_2\text{O})_6][\text{Co}(\text{SO}_4)_2(\text{H}_2\text{O})_2(\text{C}_{10}\text{H}_8\text{N}_2)][\text{Co}(\text{SO}_4)(\text{H}_2\text{O})_3(\text{C}_{10}\text{H}_8\text{N}_2)]\}_n$ (Zhong & Qian, 2012).

In the present work we describe the synthesis and structure of the new complex $[\text{Co}_2(\text{SO}_4)_2(\text{C}_{10}\text{H}_8\text{N}_2)_2(\text{C}_2\text{H}_6\text{O}_2)_2(\text{H}_2\text{O})_2]_n$, (I), which displays a three-dimensional supramolecular network with two-dimensional polymeric layers and was obtained *via* a solvo-thermal reaction. It is isotypic with the previously reported Cu^{II} and Ni^{II} analogs (Zhong *et al.*, 2011; Zhong, 2013).

There are two crystallographically unique Co^{II} metal centers in the title compound, each lying on a crystallographic two-fold axis and having a slightly distorted octahedral CoN_2O_4 coordination environment. Atom Co1 is coordinated by two 4,4'-bipyridine N atoms (N1 and N2), two sulfate ligand O atoms (O2) and two water molecule O atoms (O1W). The second Co^{II} center (Co2) is surrounded by two N atoms (N3 and N4) from two bridging 4,4-bipyridine and four O atoms, two from bridging sulfate anions (O1) and two from ethane-1,2-diol ligands (O5) (Fig. 1). The N atoms occupy the axial positions and the O atoms the equatorial sites. The Co—N bond distances [2.1223 (19)–2.1540 (19) Å], the Co—O bond distances [2.0938 (13)–2.1262 (12) Å] and the *cis* bond angles around the Co^{II} center [87.30 (3)–92.70 (3)°] are in good accord with those found in the previously reported Co-(4,4'-bipy) complexes. The bridging 4,4'-bipyridine ligand lies on a twofold axis and links two different Co^{II} cations, giving rise to the formation of one-dimensional linear $\cdots\text{Co1—bipy—Co2—bipy}\cdots$ chains along the *b* axis. The Co1 and Co2 centers of the adjacent $\cdots\text{Co1—bipy—Co2—bipy}\cdots$ chains are further cross-linked by the sulfate anions in the O—S—O bridging mode, forming linear $\cdots\text{Co1—O—SO}_2—\text{Co2—O—SO}_2—\text{O}\cdots$ chains running parallel to the *a* axis. The $\cdots\text{M—O—SO}_2—\text{O—M}\cdots$ and $\cdots\text{M—bipy—M}\cdots$ chains are almost orthogonal resulting in a two-dimensional layered polymer (Fig. 2). In the crystal structure, the two-dimensional polymeric layers are linked by extensive O—H \cdots O hydrogen-bonding involving the water molecules, ethane-1,2-diol molecules and sulfate anions leading to the formation of a three-dimensional supramolecular network structure.

S2. Experimental

Reagents and solvents used were of commercially available quality. 0.2 mmol of 4,4'-bipyridine(4,4'-bipy), 0.1 mmol of $\text{CoSO}_4 \cdot 7\text{H}_2\text{O}$, 2.0 ml of ethane-1,2-diol and 1.0 ml of water were mixed and placed in a thick Pyrex tube which was sealed and heated to 413 K for 96 h. The tube was cooled to ambient temperature and pink block-shaped crystals of the title compound were obtained.

S3. Refinement

All non-hydrogen atoms were refined anisotropically. The aromatic H atoms were positioned geometrically and allowed to ride on their parent atoms, with $\text{C—H} = 0.93 \text{ \AA}$ and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$. The H atoms of ethane-1,2-diol were geometrically placed and refined using a riding model [$\text{O—H} = 0.82 \text{ \AA}$ and $\text{C—H} = 0.97 \text{ \AA}$; $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$ and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$]. The water H atoms were either located in difference Fourier maps or placed in calculated positions so as to form a reasonable hydrogen-bond network, as far as possible. Initially, their positions were refined with tight restraints on the O—H and $\text{H}\cdots\text{H}$ distances [$0.85(1)$ and $1.35(1) \text{ \AA}$, respectively] in order to ensure a reasonable geometry. They were then constrained to ride on their parent O atom [$U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$].

**Figure 1**

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
