## $N$-Cyclohexyl-3-methylbenzamidine

## Rui-Qin Liu, Sheng-Di Bai* and Tao Wang

Institute of Applied Chemistry, Shanxi University, Taiyuan 030006, People's Republic of China
Correspondence e-mail: sdbai@sxu.edu.cn
Received 18 February 2013; accepted 5 March 2013
Key indicators: single-crystal X-ray study; $T=200 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.040 ; w R$ factor $=0.098 ;$ data-to-parameter ratio $=14.6$.

The title amidine compound, $\mathrm{C}_{14} \mathrm{H}_{20} \mathrm{~N}_{2}$, prepared by a one-pot reaction, is asymmetric as only one N atom has an alkyl substituent. The terminal cyclohexyl group connected to the amino N atom is located on the other side of the $\mathrm{N}-\mathrm{C}-\mathrm{N}$ skeleton to the 4-methylbenzene ring and has a chair conformation. The dihedral angle between the phenyl ring and the NCN plane is $47.87(12)^{\circ}$. In the crystal, molecules are linked via $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds, forming chains propagating along the $a$-axis direction.

## $N$-Cyclohexyl-3-methylbenzamidine

Rui-Qin Liu, Sheng-Di Bai and Tao Wang

## S1. Comment

The exploration of ancillary ligand systems supporting catalytically active metal centers is a long-standing demand in the coordination chemistry. Amidinates represent an important class in the array comparable to the cyclopentadienyl system (Edelmann, 1994; Barker \& Kilner, 1994; Collins, 2011). They are four-electron, monoanionic and $N$-donor bidentate chelates, demonstrating a great diversity by variation of substituents on the conjugated $\mathrm{N}-\mathrm{C}-\mathrm{N}$ backbone. Their steric and electronic properties are easily tunable to meet therequirements of different metal centers. In the course of extending amidinate chemistry, we explored a synthetic pathway to the silyl-linked bis(amidinate) ligands, $\left[\mathrm{SiMe} 2\{\mathrm{NC}(P h) \mathrm{N}(R)\}_{2}\right]^{2-}$ (Bai et al., 2006). They were applied to synthesize the Group 4 complexes, which were good catalysts for ethylene polymerization (Bai et al., 2010; Yang et al., 2013). Amidines are convenient precursors for both monoanionic amidinate ligands and bianionic ansa-bis(amidinate) ligands (Coles, 2006). Some amidines could be prepared by Yb complex catalyzed addtion reactions of aromatic amines and nitriles (Wang et al., 2008). Here, the synthesis and crystal structure of a new amidine will be described.
The title compound I was prepared by a one-pot reaction of cyclohexylamine, $\mathrm{Li} B u, m$-tolunitrile and $\mathrm{H}_{2} \mathrm{O}$. The intermediate process involved an addition reaction of lithium amide and nitrile to yield lithium monoamidinate. The suitable for X -ray investigation single-crystal of the title compound was obtained by recrystallization in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. Its molecular structure is shown in Fig. 1. Two N atoms connect the central C atom in different lengths of 1.357 (2) $\AA$ and 1.284 (2) $\AA$, composing the characteristic $\mathrm{N}-\mathrm{C}-\mathrm{N}$ skeleton for amidine species. The terminal cyclohexyl with chair-like configuration connects the amino N atom. The phenyl group is attached to the central C atom. The angle between the phenyl plane and the [NCN] plane is $47.87(12)^{\circ}$. Cyclohexyl and phenyl are in opposite directions. Fig. 2 displays the packing view of compound $\mathbf{I}$. Molecules of $\mathbf{I}$ can form the one-dimensional chain extending along $a$-axis through the intermolecular hydrogen bond. The imino N atom is the acceptor for hydrogen atom. In the chain, every adjacent two molecules have $C_{2}$ rotation symmetrical relationship with each other and the couple serves as the repeatable unit.

## S2. Experimental

A solution of $\mathrm{Li} B u(2.2 \mathrm{M}, 2.7 \mathrm{ml}, 6.0 \mathrm{mmol})$ in hexane was slowly added into a stirred solution of cyclohexylamine $(0.69 \mathrm{ml}, 6.0 \mathrm{mmol})$ in $E t_{2} \mathrm{O}(c a 30 \mathrm{ml})$ by syringe at 273 K . The reaction mixture was warmed to room temperature and kept stirring for 3 h . Then $m$-tolunitrile ( $0.71 \mathrm{ml}, 6.0 \mathrm{mmol}$ ) was added by syringe at 273 K . The reaction mixture was warmed to room temperature and kept stirring for $4 \mathrm{~h} . \mathrm{H}_{2} \mathrm{O}(0.11 \mathrm{ml}, 6.0 \mathrm{mmol})$ was added by syringe at 273 K . After stirred at room temperature for 4 h , the mixture was filtered and the filtrate was dried in vacuum to remove all volatiles. The residue was recrystallized with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and gave colourless crystals of the title compound (yield $0.96 \mathrm{~g}, 74 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=7.38-7.25(\mathrm{~m}, 4 \mathrm{H}$; phenyl), 3.81 (br, $2 \mathrm{H} ; \mathrm{NH}$ ), $2.43(\mathrm{~s}, 3 \mathrm{H} ; m-\mathrm{MePh}), 2.15-1.21(\mathrm{~m}, 11 \mathrm{H}$; $C y) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=139.3-123.6(P h), 50.4(m-M e P h), 33.8,26.5,25.6,22.0(C y)$. Anal. Calc. for $\mathrm{C}_{14} \mathrm{H}_{20} \mathrm{~N}_{2}$ (216.32): C, $77.73 ; \mathrm{H}, 9.32$; N, 12.95\%. Found: C, $77.46 ; \mathrm{H}, 9.22 ; \mathrm{N}, 13.04 \%$.

## S3. Refinement

The methyl H atoms were constrained to an ideal geometry, with $\mathrm{C}-\mathrm{H}$ distances of $0.98 \AA$ and $U_{\mathrm{iso}}(\mathrm{H})=1.5 U_{\mathrm{eq}}(\mathrm{C})$, but each group was allowed to rotate freely about its $\mathrm{C}-\mathrm{C}$ bond. The methylene H atoms were constrained with $\mathrm{C}-\mathrm{H}$ distances of $0.99 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$. The methine H atom was constrained with $\mathrm{C}-\mathrm{H}$ distance of $1.00 \AA$ and $U_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C})$. The phenyl H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms, with $\mathrm{C}-\mathrm{H}$ distances in the range $0.95 \AA$ and $U_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C})$.
The Flack parameter was omitted in CIF because no any atoms heavy Si .

## Figure 1

The molecular structure, showing the atom-numbering scheme. Displacement ellipsoids are drawn at the $30 \%$ probability level. H atoms are presented as a small spheres of arbitrary radius.

## Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$-factors based on ALL data will be even larger.
