Received 24 July 2013; accepted 1 August 2013

Key indicators: single-crystal X-ray study; $T = 98$ K; mean $\sigma(C-C) = 0.003$ Å; R factor = 0.040; wR factor = 0.100; data-to-parameter ratio = 20.0.

The asymmetric unit of title salt co-crystal, $[K(C_9H_{11}N_2S_2)(C_{12}H_{24}O_6)]$, comprises a K^+ cation, an $\text{S}_2\text{CN}(\text{Et})\text{py}$ anion and a 18-crown-6 molecule. Substantial delocalization of π -electron density is evident in the dithiocarbamate anion, as indicated by the equivalent C–S bond lengths. The K^+ cation sits within an O_6S_2 donor set lying 0.7506 (6) Å out of the least-squares plane through the six O atoms (r.m.s. deviation = 0.1766 Å) of the 18-crown-6 molecule with the two S atoms being on one side of this plane. Supramolecular layers in the bc plane, sustained by C–H \cdots O and C–H \cdots π interactions, feature in the crystal packing.

S1. Comment

The supramolecular chemistry of dithiocarbamate (S_2CNR_2) compounds compared with their xanthate (S_2COR_2) counterparts is rather limited owing to the strong chelating ability of the anion, which often precludes the possibility of forming intermolecular M···S interactions (Tan *et al.*, 2013). One way of overcoming this is to functionalize the dithiocarbamate ligand, as in the title salt co-crystal, (I), where the dithiocarbamate ligand carries a pyridyl residue. Crystal structures containing this dithiocarbamate ligand have been reported in recent years (Barba *et al.*, 2012; Singh *et al.*, 2011; Rajput *et al.*, 2012).

The asymmetric unit of (I), Fig. 1, comprises a K^+ cation, an $\text{S}_2\text{CN}(\text{Et})\text{py}$ anion and a 18-crown-6 molecule. The dithiocarbamate ligand exhibits the expected features with equivalent C—S bond lengths and a short C—N bond, Table 1, consistent with a significant contribution of the $(^{2-})\text{S}_2\text{C}=\text{N}^{(+)}(\text{Et})\text{py}$ canonical form to the overall electronic structure. The ethyl and pyridyl substituents lie to either side of the S_2CN plane, as is normally the case for dithiocarbamate anions.

The K^+ cation is coordinated by the six oxygen atoms of the 18-crown-6 molecule and the two sulfur atoms of the dithiocarbamate anion, Table 1. The cation lies 0.7506 (6) Å out of the best plane through the six oxygen atoms (r.m.s. deviation = 0.1766 Å) in the direction of the sulfur atoms. The resulting O_6S_2 donor set has a precedent in the literature, namely in the structure of $[\text{K}18\text{-crown-6}][\text{Cd}(\text{SCN})_5]$ (Harrington *et al.*, 2004).

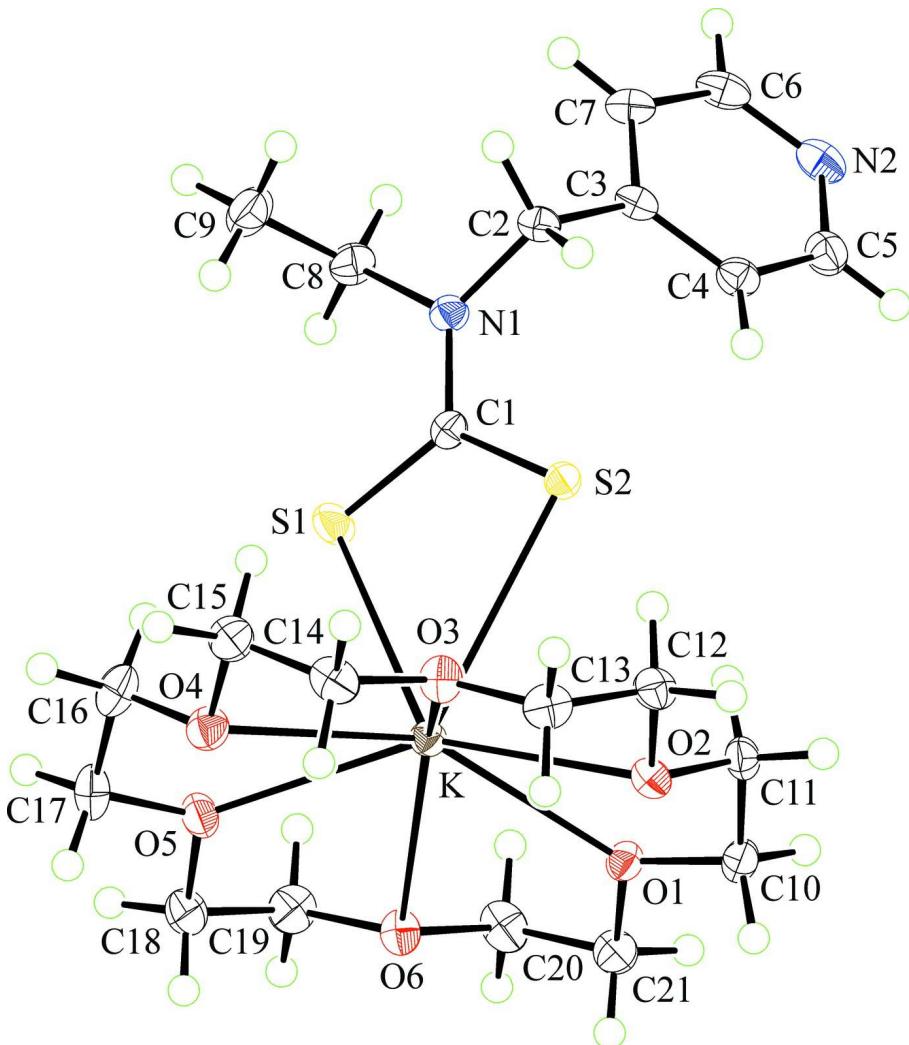

In the crystal packing, molecules assemble into supramolecular layers in the *bc* plane by a combination of pyridyl-C—H···O and methylene-C—H···π interactions, Table 2 and Fig. 2.

S2. Experimental

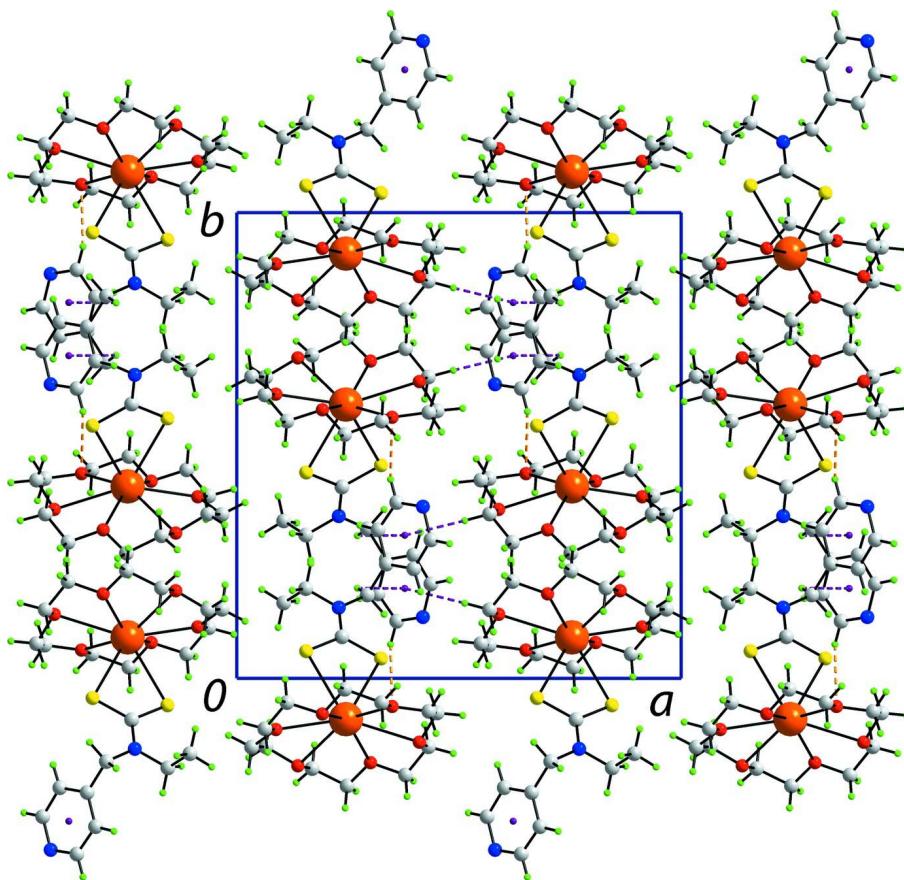

$\text{K}^+\text{S}_2\text{CN}(\text{Et})(\text{CH}_2\text{py})$ (250 mg, 1.00 mmol; prepared from 4-(ethylaminomethyl)pyridine, carbon disulfide and potassium hydroxide *via* the standard route) and 18-crown-6 (264 mg, 1.00 mmol) were dissolved in methanol (25 ml). The solution was filtered and left to evaporate slowly. As the solvent evaporated, the solution turned into yellow oil, from which crystals eventually appeared after about 10 days. Yield – quantitative. IR (cm^{-1}): 2888(*s*), 1475(*m*), 1455(*m*), 1350(ms), 1069(*s*), 960(*s*), 836(*s*). NMR ^1H : δ (p.p.m.) 8.43 (*dd*, Ar, 2.44 Hz, 1.80 Hz), 7.22 (*d*, Ar, 6.30 Hz), 5.46 (*s*, $-\text{CH}_2\text{-py}$), 3.98 (*q*, Et— CH_2 , 6.88 Hz), 3.55 (*s*, 18-crown-6), 1.07 (*t*, Me, 6.89 Hz). *M.pt.* = 409–411 K (uncorrected).

S3. Refinement

C-bound H-atoms were placed in calculated positions (C—H = 0.95–0.99 Å) and were included in the refinement in the riding model approximation with $U_{\text{iso}}(\text{H})$ set to 1.2–1.5 $U_{\text{eq}}(\text{C})$. One reflection, *i.e.* (2 0 0), was omitted from the final refinement owing to poor agreement.

**Figure 1**

Molecular structures of the components of (I), showing atom-labelling scheme and displacement ellipsoids at the 50% probability level.

**Figure 2**

Unit-cell contents in (I) viewed in projection down the c axis. The $\text{C}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\pi$ interactions are shown as orange and purple dashed lines, respectively.

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (Å, °)

Cg1 is the centroid of the N3,C3—C7 ring.

D—H···A	D—H	H···A	D···A	D—H···A
C6—H6···O1 ⁱ	0.95	2.51	3.311 (2)	143
C2—H2B···Cg1 ⁱⁱ	0.99	2.87	3.4275 (18)	116
C12—H12B···Cg1 ⁱⁱⁱ	0.99	2.95	3.820 (2)	148

Symmetry codes: (i) $x, -y+1/2, z-1/2$; (ii) $x, -y-1/2, z-3/2$; (iii) $-x+1, y+1/2, -z+1/2$.
