Received 12 August 2013; accepted 3 September 2013

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.039;  $wR$  factor = 0.099; data-to-parameter ratio = 9.1.

In the title molecule,  $C_{30}H_{35}NO_8$ , the acenaphthyleneone moiety, two atoms of a methyl pyrrolidine ring (N and C atoms) and four atoms of an ethyl acetate moiety (two C and two O atoms) are disordered over two sets of sites in ratio 0.532 (7):0.468 (7). The three C atoms of a dimethoxyethane ring and dioxolane ring attached with two methyl groups are disordered over two sets of sites in 0.66 (2):0.34 (2) and 0.62 (2):0.38 (2) ratios, respectively. The major and minor components of the acenaphthylene ring are essentially planar (r.m.s. deviations = 0.0254 and 0.0436  $\text{\AA}$ , respectively). The major and minor components of the pyrrolidine ring adopt C-envelope conformations with C atoms displaced by 0.492 (11) and 0.595 (7)  $\text{\AA}$  from the remaining ring atoms. One of the dioxolane rings is disordered with its major component in an envelope conformation [C displaced by 0.511 (11)  $\text{\AA}$ ] and the minor fraction is more or less planar with an r.m.s. deviation of 0.070  $\text{\AA}$ . The other dioxolane ring is in an envelope conformation, with a C atom displaced by 0.438 (3)  $\text{\AA}$  from the remainder of the ring atoms. The crystal packing features C—H $\cdots$ O interactions, which generate C(9) chains.

### S1. Comment

The design and novel synthesis of glycospiroheterocycles are interesting because of the synthetic challenges they present and their biological profile against viruses, bacteria, and cancer cells (Ferguson *et al.*, 2005). Pyrrolidines and pyrroles are common structural motifs in drugs and drug candidates owing to their ability to act as selective glycosidase inhibitors, which are used in the treatment of diabetes, cancer, malaria and viral infections, including AIDS (Kilonda *et al.*, 1995).

In the title molecule, the acenaphthylene moiety (O1, C1–C12), two atoms of a methyl pyrrolidine ring (N1 & C11) and four atoms of an ethyl acetate moiety (O2, O3, C18 & C19) were disordered over two sites in ratio 0.531 (7):0.469 (7). The three C atoms of a dimethoxyethane ring (C25, C26 & C27) and two methyl C atoms (C29 & C30) attached to a dioxolane ring were disordered over two sites in ratios 0.659 (2):0.341 (2) and 0.615 (7):0.385 (7), respectively. The bond distances and angles in the title compound (Fig. 1) agree very well with the corresponding bond distances and angles reported in a closely related compound (Jagadeesan *et al.*, 2012).

The major and minor components of the acenaphthylene ring (O1/C1–C12 and O1'/C1'–C12') are essentially planar (rmsd 0.0254 and 0.0436 Å, respectively). The major and minor components of pyrrolidine (C11/C14–C16/N1 & C11'/C14–C16/N1') adopt C11- and C14-envelope conformations with C atoms displaced by 0.492 (11) and 0.595 (7) °, respectively, from the remaining ring atoms. One of the dioxolane rings is disordered with major component (O5/O6/C21/C22/C25) in a C25-envelope conformation (C25 displaced by 0.511 (11) Å from the remaining ring atoms) and the minor fraction (O5/O6/C21/C22/C25') is more or less planar with rmsd 0.070 Å. The other dioxolane ring (O7/O8/C23/C24/C28) is in a C28-envelope conformation with C28 displaced by 0.438 (3) Å from the rest of the ring atoms.

The dihedral angle between the mean planes of the major acenaphthylene moiety (C1–C12/O1) and major pyrrolidine ring (C11/C14/C15/C16/N1) is 82.91 (2) °, which shows they are almost orthogonal to each other. The mean plane of the pyran ring (C20–C24/O4) forms dihedral angles of 71.40 (2) ° and 73.35 (1) ° with the mean planes of the major dioxolane ring (C21/C22/C25/O5/O6) and undisordered dioxolane ring (C23/C24/C28/O7/O8), respectively.

The crystal packing is stabilized by C23—H23···O1 intermolecular interaction (Table 1 & Fig. 2) that generates a C(9) chain running along the *c*-axis.

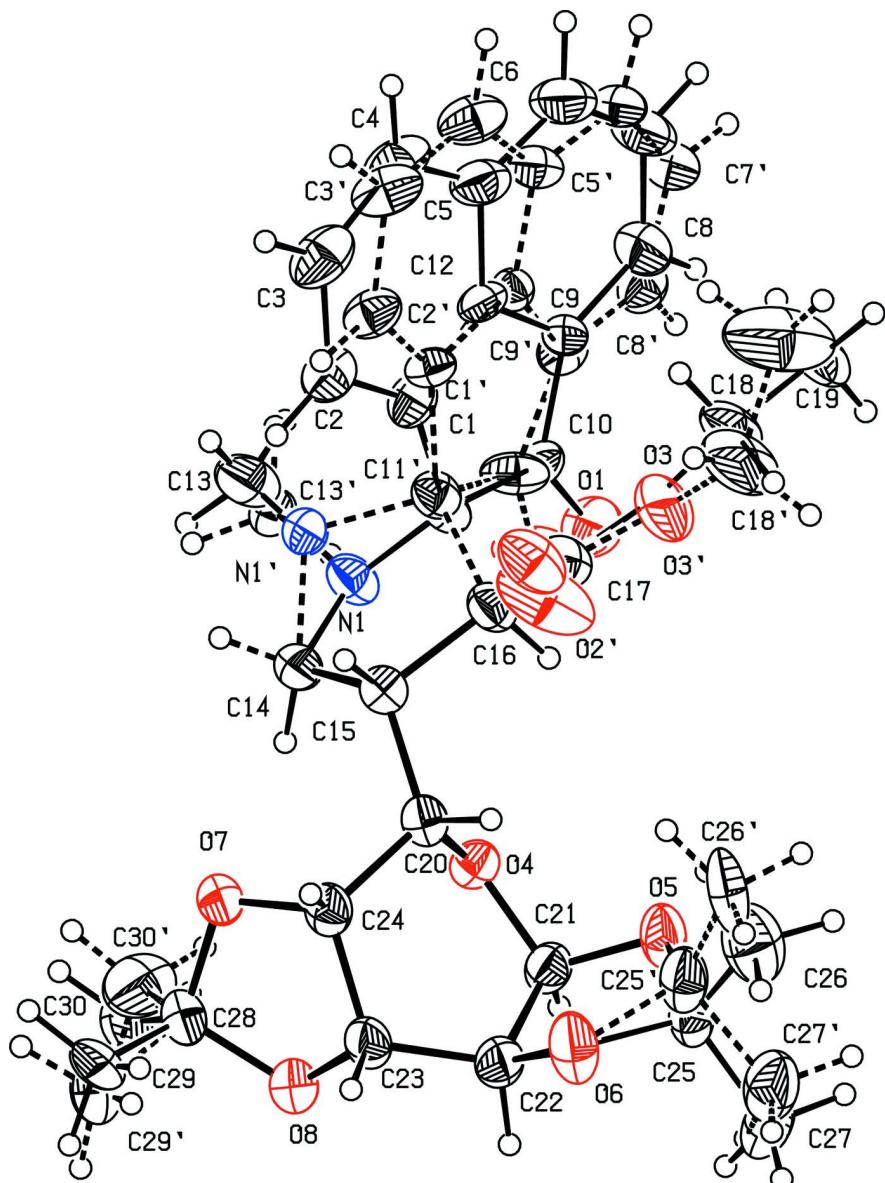

### S2. Experimental

A mixture of (*E*)-ethyl 3-((3a*R*,5*R*,5a*S*,8a*S*,8b*R*)-2,2,7,7-tetramethyltetrahydro-3a*H*-bis[1,3]dioxolo[4,5-*b*:4',5'-*d*]pyran-5-yl)acrylate (0.915 mmol, 300 mg), acenaphthenequinone (0.915 mmol, 166 mg) and sarcosine (1.0 mmol, 97 mg) was refluxed in toluene for about 7 h under Dean stark reaction condition to give the title compound in good yield.

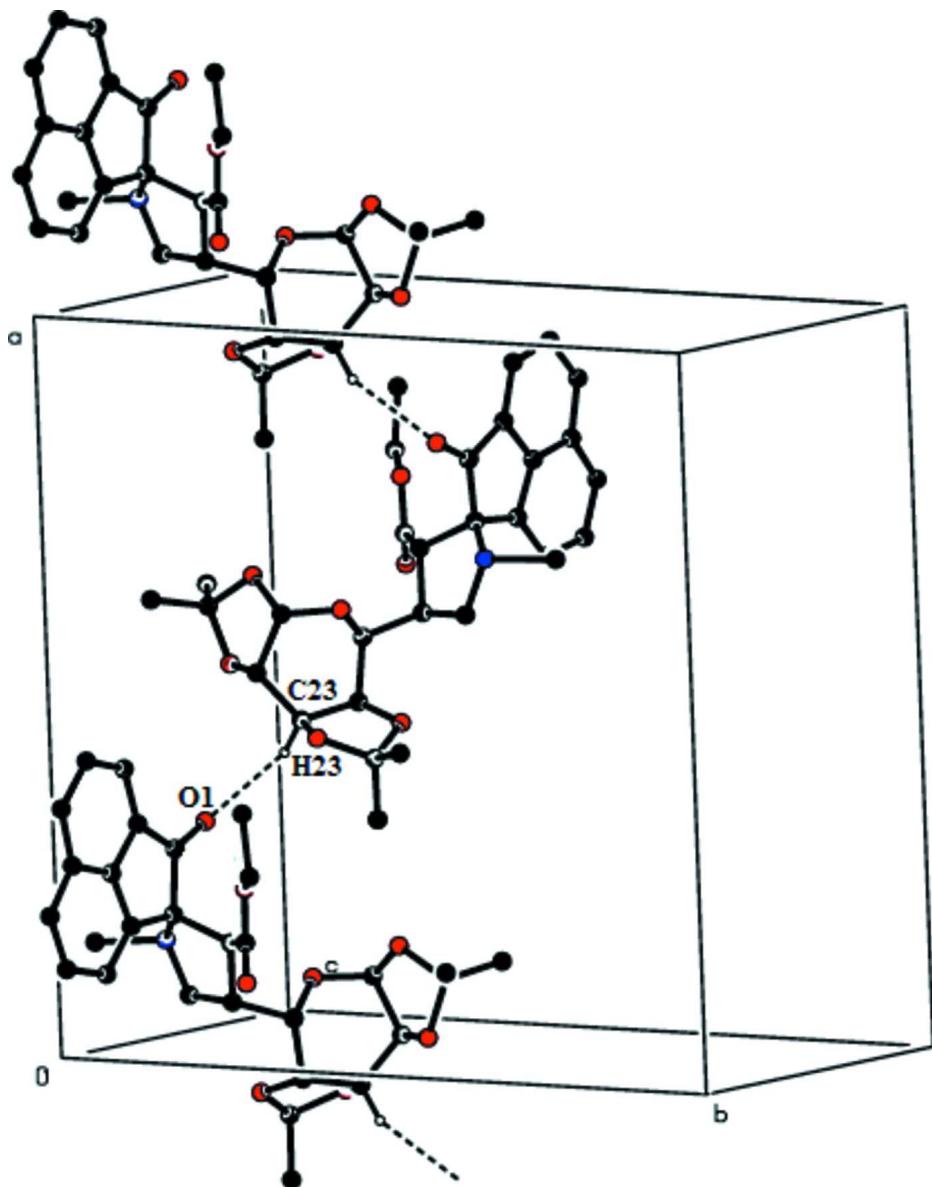

After the completion of reaction as indicated by TLC, solvent was evaporated under reduced pressure. The crude product was purified by column chromatography using hexane: EtOAc (7:3) as eluent.

**S3. Refinement**

In the acenaphthylenone moiety (C1–C12/O1), N1 and C13 atoms of the methyl pyrrolidine ring and C18/C19/O2/O3 atoms of the ethyl acetate moiety were disordered over two positions with the site occupancy factors 0.531 (7):0.469 (7). The dimethoxyethane ring C25/C26/C27 atoms and dioxolane ring attached with two methyl groups C29/C30 atoms were disordered over two positions with the site occupancy factors 0.659 (2):0.341 (2) and 0.615 (7): 0.385 (7). The bond distances of the major and minor components were restrained to a value of  $d(C-C) = 1.39$  (1) Å for aromatic ring,  $d(C-C) = 1.50$  (1) Å for aliphatic ring and  $d(C-O) = 1.30$  (1) Å, respectively. The bond distances of the disordered components were restrained using standard similarity restraint SADI [*SHELXL97*, Sheldrick, 2008] with s.u. of 0.01 Å. Hydrogen atoms were placed in calculated positions with  $C-H = 0.93$  to 0.98 Å refined in the riding model with fixed isotropic displacement parameters:  $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{C})$  for methyl group and  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$  for other groups. In the absence of significant anomalous dispersion effects, an absolute structure was not determined and 1505 Friedel pairs were merged.

**Figure 1**

The molecular structure of the title compound with the atom numbering scheme, displacement ellipsoids are drawn at 30% probability level. H-atoms are present as small spheres of arbitrary radius. The minor fractions of the disordered carbon atoms have been represented by broken bonds.

**Figure 2**

The crystal packing of the title compound viewed down *c* axis. Dashed lines indicates C23—H23···O1 interaction generates a C(9) chain, H-atoms not involved in hydrogen bonds have been excluded for clarity.

 $\Delta\rho_{\min} = -0.11 \text{ e \AA}^{-3}$   
 Extinction correction: *SHELXL97* (Sheldrick, 2008),  $Fc^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$   
 Extinction coefficient: 0.0099 (8)

#### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
