Received 14 March 2014; accepted 9 May 2014

Key indicators: single-crystal X-ray study;  $T = 120$  K; mean  $\sigma(\text{C}-\text{C}) = 0.005$  Å;  $R$  factor = 0.031;  $wR$  factor = 0.058; data-to-parameter ratio = 16.8.

The asymmetric unit of the title compound,  $[\text{PdCl}(\text{C}_9\text{H}_{12}\text{NSE})(\text{C}_{18}\text{H}_{15}\text{P})]$ , contains two independent molecules. In both cases, the  $\text{Pd}^{2+}$  cations are coordinated by the Se and N atoms of the chelating bidentate 2-[dimethylamino)methyl]-benzeneselenolate ligand. The chloride ligand lies *trans* to selenium and the triphenylphosphane ligand is *trans* to nitrogen. The  $\text{Pd}-\text{Se}$  bond lengths in the two independent coordination environments of Pd are 2.3801 (4) and 2.3852 (4) Å, the  $\text{Pd}-\text{P}$  bond lengths are 2.2562 (8) and 2.2471 (8) Å, the  $\text{Pd}-\text{N}$  bond lengths are 2.172 (2) and 2.158 (2) Å, and the  $\text{Pd}-\text{Cl}$  bond lengths are 2.3816 (8) and 2.3801 (8) Å. The square-planar coordination around one  $\text{Pd}^{2+}$  cation is less distorted than that around the other.

## Chlorido{2-[*(dimethylamino)methyl*]benzeneselenolato- $\kappa^2N,Se$ }(triphenylphosphane- $\kappa P$ )palladium(II)

Esther M. Takaluoma, Raija Oilunkaniemi and Risto S. Laitinen

### S1. Comment

The ligand exchange reactions of  $[MCl_2(PPh_3)_2]$  ( $M = Pd, Pt$ ) by organoselenolates afford mononuclear metal complexes in the case of platinum, (see for instance, Hannu *et al.*, 2000, Hannu-Kuure *et al.*, 2003a), but in case of palladium dinuclear or complexes of even higher nuclearity are generally obtained, as exemplified by Hannu-Kuure *et al.* (2003b, 2004) and Wagner *et al.* (2005). Mononuclear palladium complexes can be obtained by using chelating phosphines such as 1,2-bis(diphenylphosphino)ethane (Risto *et al.*, 2007). Organoselenolates containing additional donor atoms can also form stable monomeric palladium complexes. We are interested in the use of the monomeric palladium chalcogenolato complexes as building blocks for the systematic construction of polynuclear metal complexes.

$[PdX(C_9H_{12}NSe)(C_{18}H_{15}P)]$  ( $X = Br, I$ ) has recently been prepared by the oxidative addition of  $[2-(N,N\text{-dimethylamino})methyl]phenylselenenylbromide$  or -iodide to  $[(Ph_3P)_4Pd]$  by Chakraborty *et al.* (2011). They also reported the crystal structure of  $[PdI(C_9H_{12}NSe)(C_{18}H_{15}P)]$ . In this work, the title compound,  $[PdCl(C_9H_{12}NSe)(C_{18}H_{15}P)]$ , was formed by the ligand exchange reaction of  $[PdCl_2(PPh_3)_2]$  and lithium  $[2-(N,N\text{-dimethylamino})methyl]benzeneselenolate$ . The  $^{77}Se$  NMR spectrum showed, in addition to the chemical shift of the title compound at 258 p.p.m., also a resonance at 422 p.p.m.. It is possible that the selenolate has been oxidized during the reaction and formed a diselenide, the chemical shift of which has also been reported by Chakraborty *et al.* (2011).

The asymmetric unit of the title compound contains two discrete complexes. Both Pd atoms show a distorted square-planar coordination. The bidentate  $[2-(N,N\text{-dimethylamino})methyl]benzeneselenolato$  chelating ligand is bonded to the metal center *via* selenium and nitrogen donor atoms. The chlorido ligand lies *trans* to selenium and the triphenylphosphine ligand *trans* to nitrogen. While the P—Pd—Cl and Cl—Pd—N angles in both independent complexes in the asymmetric unit are almost identical (P1—Pd1—Cl1 86.56 (3) $^\circ$ , P2—Pd2—Cl2 86.75 (3) $^\circ$  and Cl1—Pd1—N1 90.80 (7) $^\circ$ , Cl2—Pd2—N2 90.79 (7) $^\circ$ ), the differences are more prominent in the case of the P—Pd—Se and Se—Pd—N angles (P1—Pd1—Se1 90.14 (2) $^\circ$ , P2—Pd2—Se2 88.69 (2) $^\circ$  and Se1—Pd1—N1 92.62 (6) $^\circ$ , Se2—Pd2—N2 94.53 (7) $^\circ$ ). The sum of the bond angles around Pd1 is 360.12 $^\circ$  and around Pd2 360.76 $^\circ$ . However, the computation of the least-squares planes of the square-planar coordination environments involving Pd1 and Pd2 indicates that in both cases the atoms deviate from planarity. The distortion is more prominent for Pd2 than for Pd1.

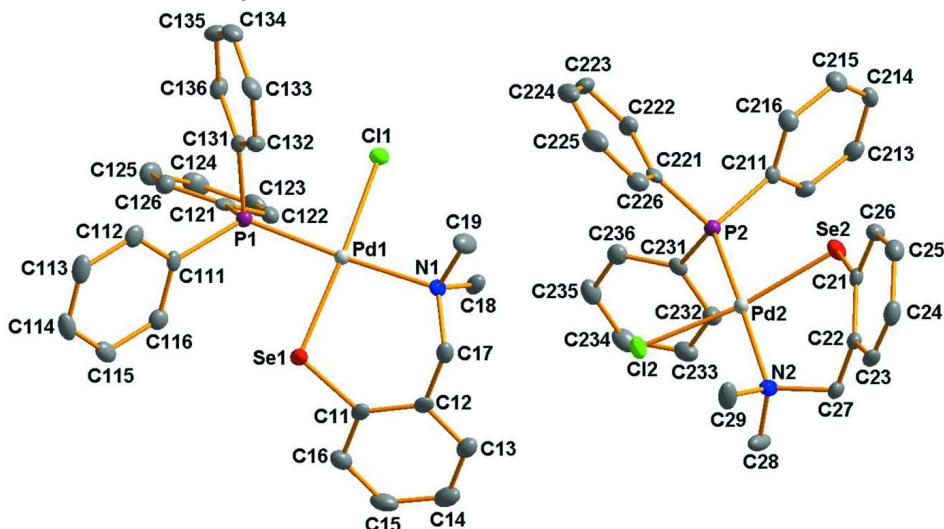

The bond lengths and angles around the Pd atoms are shown in Table 1. The Pd1—Se1 bond length is 2.3801 (4) Å and Pd2—Se2 2.3852 (4) Å. They are consistent with the Pd—Se bond (2.4218 (3) Å, 295 (2) K) in the iodido analogue (Chakraborty *et al.*, 2011). The Pd—N bond lengths are 2.172 (2) Å and 2.158 (2) Å, the Pd—Cl are lengths 2.3816 (8) Å and 2.3801 (8) Å, and the Pd—P lengths are 2.2562 (8) Å and 2.2471 (8) Å. The Pd—N and Pd—P lengths in the iodido complex are 2.1958 (18) Å and 2.2429 (5) Å, respectively (Chakraborty *et al.*, 2011).

**S2. Experimental**

Freshly prepared diethyl ether solution of lithium[2-(*N,N*-dimethylamino)methyl]benzeneselenolate (2 ml; 0.089 mmol/ml) was added to [PdCl<sub>2</sub>(PPh<sub>3</sub>)<sub>2</sub>] (0.051 g, 0.073 mmol) in 4 ml of THF in an 10 mm NMR tube under an argon atmosphere. The solution immediately turned red and the <sup>31</sup>P and <sup>77</sup>Se NMR spectra were recorded. Slow evaporation of the solution gave a small crop of red crystals of [PdCl(C<sub>9</sub>H<sub>12</sub>NSe)(C<sub>18</sub>H<sub>15</sub>P)]. NMR data of the title compound: <sup>77</sup>Se NMR 258 p.p.m., <sup>31</sup>P NMR 32.2 p.p.m..

**S3. Refinement**

H atoms were positioned geometrically and refined using a riding model with C—H = 0.95 Å and with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$  and 0.98 Å and  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$  for the aryl and methyl H atoms, respectively.

**Figure 1**

The molecular structure of the title compound indicating the numbering of the atoms. The thermal ellipsoids have been drawn at 50% probability. The hydrogen atoms have been omitted for clarity.

 $w = 1/[\sigma^2(F_o^2) + (0.0251P)^2]$   
 where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} = 0.001$   
 $\Delta\rho_{\max} = 0.65 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.40 \text{ e } \text{\AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
