Received 9 April 2014; accepted 30 April 2014

Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(\text{Sc}-\text{Cl}) = 0.001 \text{ \AA}$ ;  $R$  factor = 0.023;  $wR$  factor = 0.050; data-to-parameter ratio = 68.6.

Crystals of tricaesium scandium(III) hexachloride were obtained as a side product from the reaction of U, SnCl<sub>2</sub>, Sc, and S in a CsCl flux at 1073 K. Cs<sub>3</sub>ScCl<sub>6</sub> crystallizes in the Rb<sub>3</sub>YCl<sub>6</sub> structure type. The asymmetric unit comprises three Cs sites, two Sc sites, and six Cl sites, all of which have site symmetry 1, except for the two Sc sites that have site symmetries of 2 and  $\bar{1}$ , respectively. The structure is composed of isolated [ScCl<sub>6</sub>]<sup>3-</sup> octahedra that are surrounded by Cs<sup>+</sup> cations. Two Cs<sup>+</sup> cations have interactions with eight Cl<sup>-</sup> anions, while the third has interactions with ten Cl<sup>-</sup> anions.

### Related literature

Cs<sub>3</sub>ScCl<sub>6</sub> crystallizes in the Rb<sub>3</sub>YCl<sub>6</sub> structure type (space group  $C2/c$ ; Mattfeld & Meyer, 1992). Previously, a number of ternary scandium halides of the composition  $A_3\text{Sc}X_6$  were characterized by single-crystal X-ray diffraction or Rietveld refinements from powder data. These include Na<sub>3</sub>ScF<sub>6</sub> (Dahlke & Babel, 1994), Na<sub>3</sub>ScBr<sub>6</sub> (Bohnsack & Meyer, 1996), Li<sub>3</sub>ScCl<sub>6</sub> (Bohnsack *et al.*, 1997), Li<sub>3</sub>ScF<sub>6</sub> (Tyagi *et al.*, 2005), K<sub>3</sub>ScCl<sub>6</sub> (Cerny *et al.*, 2010a), and Na<sub>3</sub>ScCl<sub>6</sub> (Cerny *et al.*, 2010b). Except for Li<sub>3</sub>ScCl<sub>6</sub>, these compounds crystallize in one of two structure types: Na<sub>3</sub>CrCl<sub>6</sub> ( $P\bar{3}1c$ ; Friedrich *et al.*, 1987) or Na<sub>3</sub>AlF<sub>6</sub> ( $P2_1/n$ ; Náray-Szabó & Sasvári, 1938). For other caesium scandium chloride compounds, see: Poeppelmeier *et al.* (1980). For standardization of structure data, see: Gelato & Parthé (1987).

## **Cs<sub>3</sub>ScCl<sub>6</sub>**

**Matthew D. Ward and James A. Ibers**

### **S1. Comment**

Ternary scandium halides of the composition  $A_3ScX_6$  are known for  $A = Li, Na, K$  and  $X = F, Cl, Br$ . These compounds crystallize in either the  $Na_3CrCl_6$  ( $P\bar{3}1c$ ) (Friedrich *et al.*, 1987) or the  $Na_3AlF_6$  ( $P2_1/n$ ) (Náray-Szabó & Sasvári, 1938) structure types, except for  $Li_3ScCl_6$  which crystallizes in space group  $C2/m$  (Bohnsack *et al.*, 1997). Single-crystal refinements have been carried out for  $Na_3ScF_6$  (Dahlke & Babel, 1994),  $Na_3ScBr_6$  (Bohnsack & Meyer, 1996),  $Li_3ScCl_6$  (Bohnsack *et al.*, 1997), and  $Li_3ScF_6$  (Tyagi *et al.*, 2005). The structures of  $K_3ScCl_6$  (Cerny *et al.*, 2010a) and  $Na_3ScCl_6$  (Cerny *et al.*, 2010b) were determined by Rietveld refinement of X-ray powder data.  $Cs_3ScCl_6$  is the first Cs-containing compound of the  $A_3ScX_6$  family. It crystallizes in the monoclinic space group  $C2/c$  in the  $Rb_3YCl_6$  structure type (Mattfeld & Meyer, 1992).

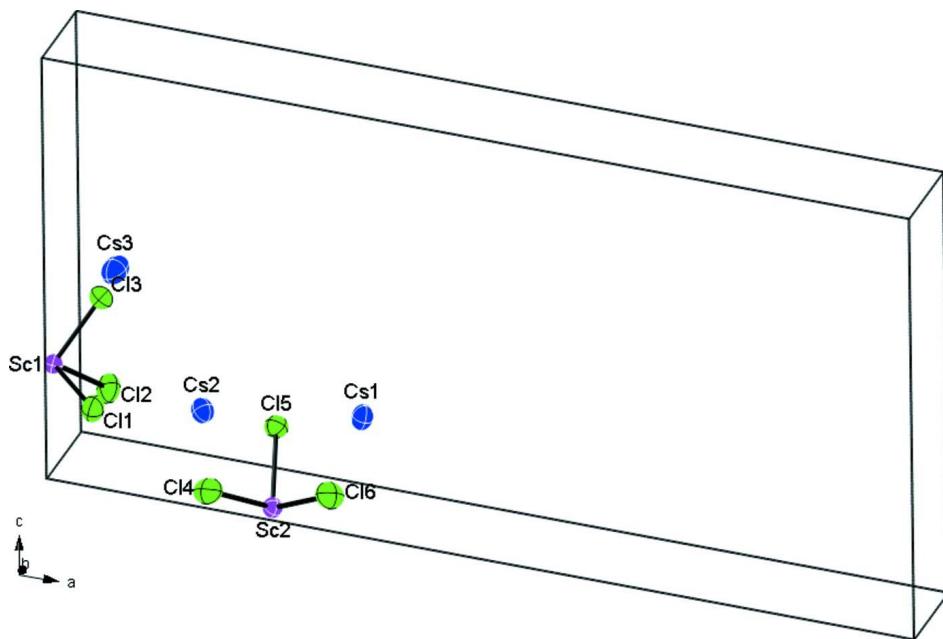

The structure of  $Cs_3ScCl_6$  is composed of isolated  $[ScCl_6]^{3-}$  octahedra that are surrounded by  $Cs^+$  cations. The asymmetric unit, comprising three Cs, two Sc, and six Cl sites, is shown in Fig. 1, and a packing diagram is shown in Fig. 2. The composition achieves charge balance by assigning formal oxidation states of +1, +3, and -1 to Cs, Sc, and Cl, respectively. The Sc—Cl distances range from 2.4718 (5) Å to 2.5072 (6) Å at 100 K. These distances compare favorably with those of 2.601 Å at 298 K in  $Cs_3Sc_2Cl_9$  (Poeppelmeier *et al.*, 1980). Another caesium scandium chloride compound is  $CsScCl_3$  (Poeppelmeier *et al.*, 1980), which reportedly contains Sc(II).

### **S2. Experimental**

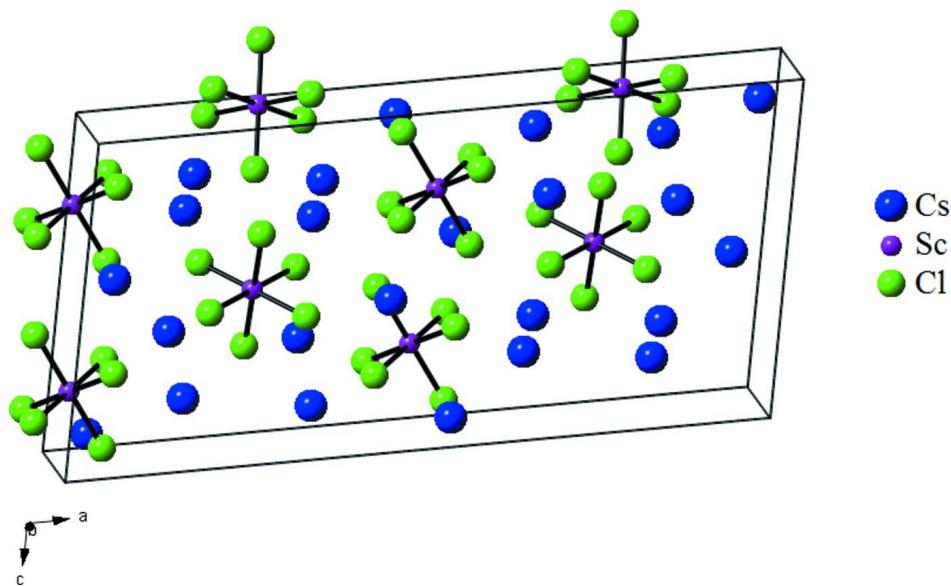

A reaction mixture containing U (0.126 mmol),  $SnCl_2$  (0.126 mmol), Sc (1.290 mmol), S (0.378 mmol), and  $CsCl$  (0.594 mmol) was loaded into a carbon-coated fused-silica tube under an inert Ar atmosphere. The tube was then evacuated to  $10^{-4}$  Torr, flame sealed, and placed in a computer-controlled furnace. The tube was heated to 1073 K in 12 h, held there for 96 h, cooled to 773 K at a rate of 2 K/h, and then cooled to 298 K over a further 48 h. The reaction yielded black rectangular prisms of  $ScU_8S_{17}$ , purple blocks of  $Cs_3ScCl_6$ , and excess  $CsCl$  flux. Crystals of  $Cs_3ScCl_6$  were also found as side products in other reactions that contained Sc and a  $CsCl$  flux. Crystals of  $Cs_3ScCl_6$  are soluble in water.

### **S3. Refinement**

Atomic positions were standardized with the program *STRUCTURE TIDY* (Gelato & Parthé, 1987). The highest peak of 1.0 (2) e<sup>-</sup>/Å<sup>3</sup> is 2.18 Å from atom Cs2 and the deepest hole of -1.3 (2) e<sup>-</sup>/Å<sup>3</sup> is 0.92 Å from atom Cs3.

**Figure 1**

The asymmetric unit of  $\text{Cs}_3\text{ScCl}_6$ . Displacement ellipsoids at the 99% probability level are shown. Caesium atoms are blue, scandium atoms are purple, and chlorine atoms are green.

**Figure 2**

Packing of  $\text{Cs}_3\text{ScCl}_6$  viewed nearly along the  $b$  axis.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
