The title compounds, $\mathrm{C}_{11} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}(\mathrm{H} L 1)$ and $\mathrm{C}_{11} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}(\mathrm{H} L 2)$, are pyridine 2ylmethyl and 4-ylmethyl derivatives, respectively, of pyrazine-2-carboxamide. $\mathrm{H} L 1$ was measured at 153 K and crystallized in the monoclinic space group $P 2_{1} / c$ with $Z=4$. There has been a report of the same structure measured at room temperature but assumed to crystallize in the triclinic space group $P \overline{1}$ with $Z=4$ [Sasan et al. (2008). Monatsh. Chem. 139, 773-780]. In HL1, the pyridine ring is inclined to the pyrazine ring by $61.34(6)^{\circ}$, while in $\mathrm{H} L 2$ this dihedral angle is $84.33(12)^{\circ}$. In both molecules, there is a short $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ interaction involving the pyrazine carboxamide unit. In the crystal of $\mathrm{H} L 1$, molecules are linked by $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds, forming inversion dimers with an $R_{2}^{2}(10)$ ring motif. The dimers are linked via bifurcated-acceptor $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming sheets lying parallel to (102). The sheets are linked via $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds, forming a three-dimensional structure. In the crystal of HL2, molecules are linked by $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds to form chains propagating along [010]. The chains are linked via $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming sheets lying parallel to (100). Within the sheets there are $\pi-\pi$ interactions involving neighbouring pyrazine rings [inter-centroid distance $=$ 3.711 (15) Å]. Adjacent sheets are linked via parallel slipped $\pi-\pi$ interactions involving inversion-related pyridine rings [inter-centroid distance = 3.6395 (17) Å], forming a three-dimensional structure.

## 1. Chemical context

The title compounds form part of a series of ligands synthesized in order to study their coordination chemistry with $3 d$ transition metals (Cati, 2002).

HL1

HL2
They have been used to construct coordination polymers and multi-nuclear compounds, and to study their magnetic

properties (Cati et al., 2004). Similar ligands have been synthesized by other groups who have studied, for example, the magnetic properties of some copper(II) complexes (Hausmann et al., 2003; Kingele et al., 2007).

## 2. Structural commentary

The molecular structure of ligand $\mathrm{H} L 1$ is illustrated in Fig. 1. HL1 was measured at 153 K and crystallized in the monoclinic space group $P 2_{1} / \mathrm{c}$ with $Z=4$. The $\beta$ angle is $91.461(11)^{\circ}$ and the systematic absences, the $R_{\text {int }}$ value ( 0.0348 ) and the successful refinement $\{R 1[I>2 \sigma(I)]=0.0319\}$ clearly show that at 153 K the space group is monoclinic $P 2_{1} / \mathrm{c}$. The same structure measured at room temperature was reported to crystallize in the triclinic space group $P \overline{1}$ with $Z=4$ (Sasan et al., 2008). However, the three cell angles are close $90(2)^{\circ}[\alpha=$ 91.802 (6), $\beta=89.834$ (7), $\gamma=91.845$ (6) $\left.{ }^{\circ}\right]$ and the crystal used was a very narrow needle. The final $R 1[I>2 \sigma(I)]$ factor was rather high at 0.0699 , hence it is possible that the choice of crystal system and space group are incorrect. However, this could not be confirmed when analysing the coordinates using the AddSymm routine in PLATON (Spek, 2009).

In the molecule of $\mathrm{H} L 1$ there is a short $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond present in the pyrazine carboxamide unit (Table 1), and the amide group, $\mathrm{C} 5(=\mathrm{O} 1) \mathrm{N} 3$, is approximately coplanar with

Figure 2

the pyrazine $(\mathrm{N} 1 / \mathrm{N} 2 / \mathrm{C} 1-\mathrm{C} 4)$ ring [dihedral angle $=2.56(14)^{\circ}$ ]. The pyrazine and pyridine ( $\mathrm{N} 4 / \mathrm{C} 7-\mathrm{C} 10$ ) rings are inclined to one another by $61.34(6)^{\circ}$. In the triclinic structure mentioned above, the same angle in the two independent molecules is 63.31 (13) and $61.94(13)^{\circ}$.

The molecular structure of HL2 is illustrated in Fig. 2. Here too there is a short intramolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ contact involving the pyrazine carboxamide unit (Table 2), and the amide group, $\mathrm{C} 5(=\mathrm{O} 1) \mathrm{N} 3$, is almost coplanar with the pyrazine ( $\mathrm{N} 1 /$ N2/C1-C4) ring with a dihedral angle of $3.9(3)^{\circ}$. Here the pyrazine and pyridine ( $\mathrm{N} 4 / \mathrm{C} 7-\mathrm{C} 10$ ) rings are almost normal to one another with a dihedral angle of $84.33(12)^{\circ}$.

Figure 3
A partial view along the $a$ axis of the crystal packing of compound $\mathrm{H} L 1$. The $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}, \mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds are shown as dashed lines (see Table 1 for details).

Figure 4
The crystal packing of compound $\mathrm{H} L 1$ viewed along the $b$ axis. The $\mathrm{N}-$ $\mathrm{H} \cdots \mathrm{N}, \mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds are shown as dashed lines (see Table 1 for details).

## 3. Supramolecular features

In the crystal of $\mathrm{H} L 1$, molecules are linked by $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds, forming inversion dimers with an $R_{2}^{2}(10)$ ring motif. The dimers are linked via bifurcated-acceptor $\mathrm{C}-$ H. . O hydrogen bonds, forming sheets lying parallel to (102) (see Table 1 and Fig. 3). The sheets are linked via $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds, forming a three-dimensional structure (Table 1 and Fig. 4).

Figure 5

A partial view along the $c$ axis of the crystal packing of compound $\mathrm{HL2}$. The $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$, and $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds are shown as dashed lines (see Table 2 for details).

Figure 6
The crystal packing of compound $\mathrm{H} L 2$ viewed along the $c$ axis. The $\mathrm{N}-$ $\mathrm{H} \cdots \mathrm{N}, \mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds are shown as dashed lines (see Table 2 for details).

In the crystal of $\mathrm{H} L 2$, molecules are linked by $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds to form chains propagating along [010], as shown in Table 2 and Fig. 5. The chains are linked via $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming sheets lying parallel to (100). Within the sheets there are $\pi-\pi$ interactions involving neighbouring pyrazine rings $\left[C g 1 \cdots C g 1^{i}=\right.$ 3.7113 (15) $\AA ; C g 1$ is the centroid of the pyrazine ring $\mathrm{N} 1 / \mathrm{N} 2 /$ $\mathrm{C} 1-\mathrm{C} 4$; symmetry code: (i) $\left.=x,-y+\frac{1}{2}, z-\frac{1}{2}\right]$. The sheets are linked via slipped parallel $\pi-\pi$ interactions involving inver-sion-related pyridine rings $\left[C g 2 \cdots C g 2^{\mathrm{ii}}=3.6395(11) \AA\right.$, normal distance $=3.4164(11)$, slippage $=1.255 \AA ; C g 2$ is the centroid of pyridine ring N4/C7-C11; symmetry code: (ii) $-x$, $-y,-z$ ], forming a three-dimensional structure (Table 2 and Fig. 6).

## 4. Database survey

A search of the Cambridge Structural Database (Version 5.35, last update November 2013; Allen, 2002) indicated the presence of 282 structures containing the pyrazine-2-carboxamide unit. 81 of these concern pyrazine-2-carboxamide itself. There were 10 hits for complexes of ligand $\mathrm{H} L 1$. These include a cobalt(III) (Hellyer et al., 2009), a chromium(III) (Khavasi et al., 2010) and four copper(II) complexes (Mohamadou et al., 2012; Khavasi et al., 2011), all of which are mononuclear with the ligand coordinating in a tridentate manner. There are also two polymeric mercury chloride complexes (Khavasi \& Sadegh, 2010), a binuclear manganese chloride complex (Khavasi et al., 2009), and a polymeric silver tetrafluoroborate complex (Hellyer et al., 2009), where the ligand coordinates in a bis-monodentate manner. Plus the report of the ligand itself as mentioned above (Sasan et al., 2008). For ligand HL2 there were no hits.

## 5. Synthesis and crystallization

The precursor pyrazine-2-carboxylic acid methyl ester (2-pze) was prepared following the procedure described by AlvarezIbarra et al. (1994). $6.21 \mathrm{~g}(50 \mathrm{mmol})$ of pyrazine-2-carboxylic acid were added to 50 ml of absolute methanol in a twonecked flask $(100 \mathrm{ml})$. The mixture was heated to 303 K and then 0.4 ml of concentrated sulfuric acid was added slowly. The mixture was heated for 23 h , at least. It was then poured over ice and made alkaline using $\mathrm{NaOH}(2 \mathrm{~N})$, then extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic extract was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The resulting yellow product was purified by recrystallization from hexane, or by column chromatography on silica gel using $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as eluant, giving finally colourless crystals (yield $80 \%$ ).

The ligand HL1 was prepared by refluxing 2-pze ( 1.80 g , $13 \mathrm{mmol})$ and an excess of 2-(aminomethyl)pyridine ( 1.84 g , 17 mmol ) in 12 ml of methanol, for 6 h in a two-necked flask $(50 \mathrm{ml})$. A yellowish oil remained when the methanol was evaporated off. The excess of 2-(aminomethyl)pyridine was eliminated by column chromatography on silica gel using $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as eluant ( $r=2 \mathrm{~cm}, l=8 \mathrm{~cm}$ ). A yellow band of 2-(aminomethyl)pyridine remained on the column. After evaporation, the ligand could be recrystallized from diethyl ether, acetonitrile or ethyl acetate. $\mathrm{H} L 1$ is very soluble in MeOH and in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. Recrystallization from diethyl ether gave colourless blocks of HL1 (yield $91 \%$; m.p. 388 K ). Analysis for $\mathrm{C}_{11} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}\left(M_{r}=214.46 \mathrm{~g} / \mathrm{mol}\right)$ Calculated (\%) C: $61.67 \mathrm{H}: 4.71 \mathrm{~N}: 26.15$; Found (\%) C: $61.80 \mathrm{H}: 4.76 \mathrm{~N}: 26.45$. Spectroscopic data are available in the supporting information.
$\mathrm{H} L 2$ was prepared using the same procedure as for $\mathrm{H} L 1$. 2-pze $(1.38 \mathrm{~g}, \quad 10 \mathrm{mmol})$ with, this time, an excess of 4-(aminomethyl)pyridine $(1.73 \mathrm{~g}, 16 \mathrm{mmol})$ were refluxed in 20 ml of methanol, for 20 h in a two-necked flask ( 50 ml ). 4-(aminomethyl)pyridine ( $1 \mathrm{~g}, 10 \mathrm{mmol}$ ) was then added to the red solution. After 4 h the solution was evaporated to about $8 \mathrm{ml} . \mathrm{H} L 2$ crystallized out at room temperature. About 20 ml of diethyl ether was added to filtrate the product. It was then recrystallized from a mixture of 3 ml of methanol and 40 ml of diethyl ether to give colourless blocks (yield $84 \%$; m.p. 422 K ). Anal. for $\mathrm{C}_{11} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}\left(M_{r}=214.46 \mathrm{~g} / \mathrm{mol}\right)$ Calculated (\%) C: 61.67 H: $4.71 \mathrm{~N}: 26.15$ Found (\%) C: $61.57 \mathrm{H}: 4.75 \mathrm{~N}: 26.20$. Spectroscopic data are available in the supporting information.

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. The NH H atoms were located in difference Fourier maps and freely refined. The C-bound H atoms were included in calculated positions and treated as riding atoms: $\mathrm{C}-\mathrm{H}=0.95 \AA$ for $\mathrm{H} L 1$ and $=0.93 \AA$ for $\mathrm{H} L 2$, with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$.

& \Delta \rho_{\min }=-0.17 \mathrm{e}^{-3}
\end{aligned}
$$

## Special details

Experimental. Spectrosopic data for $\mathrm{H} L 1:{ }^{1} \mathrm{H}$ NMR ( 400 MHz , DMSO-d6; code $\mathrm{Hh} / \mathrm{NH}, \mathrm{Hl} / \mathrm{C} 3, \mathrm{Hn} / \mathrm{C} 1, \mathrm{Hm} / \mathrm{C} 2$, $\mathrm{Hb} / \mathrm{C} 11, \mathrm{Hd} / \mathrm{C} 9, \mathrm{He} / \mathrm{C} 8, \mathrm{Hc} / \mathrm{C} 10, \mathrm{Hg} / \mathrm{C} 6): 9.50(\mathrm{t}, 1 \mathrm{H}, \mathrm{Jhg}=6.0, \mathrm{Hh}) ; 9.23(\mathrm{~d}, 1 \mathrm{H}, \mathrm{Jlm}=1.5, \mathrm{Hl}) ; 8.91(\mathrm{~d}, 1 \mathrm{H}, \mathrm{Jnm}=2.5$, $\mathrm{Hn}) ; 8.78(\mathrm{dd}, 1 \mathrm{H}, \mathrm{Jmn}=2.5, \mathrm{Jml}=1.5, \mathrm{Hm}) ; 8.53(\mathrm{ddd}, 1 \mathrm{H}, \mathrm{Jbc}=4.8, \mathrm{Jbd}=1.8$, Jbe $=0.8, \mathrm{Hb}) ; 7.76(\mathrm{td}, 1 \mathrm{H}, \mathrm{Jdc}=7.7$, $\mathrm{Jdb}=1.8, \mathrm{Hd}) ; 7.35\left(\mathrm{~d}, 1 \mathrm{H}, \mathrm{Jed}=7.9\right.$, He); $7.28(\mathrm{dd}, 1 \mathrm{H}, \mathrm{Jcd}=7.7$, Jcb $=4.8, \mathrm{Hc}) ; 4.64(\mathrm{~d}, 2 \mathrm{H}, \mathrm{Jgh}=6.0, \mathrm{He}) .{ }^{13} \mathrm{C}$ NMR ( 400 MHz , DMSO-d6): 163.9, 158.6, 149.7, 148.6, 145.5, 144.4, 144.3, 137.6, 123.1, 121.9, 45.0. IR (KBr pellet, $\mathrm{cm}^{-1}$ ): 3248 (m), 3066 (w), 3018 (w), 2949 (w), 1669 (versus), 1593 ( m ), 1570 (m), 1517 (versus), 1478 (m), 1462 ( $s$ ), 1440 ( $s$ ), $1423(s), 1389(s), 1350(m), 1320(m), 1287(s), 1250(m), 1221(m), 1168(s), 1148(m), 1103(m), 1055(m), 1021(s)$, $1000(\mathrm{~m}), 975(\mathrm{~m}), 870(\mathrm{~m}), 840(\mathrm{w}), 776(\mathrm{~m}), 753(\mathrm{~s}), 707(\mathrm{~m}), 634(\mathrm{~m}), 611(\mathrm{~m}), 528(\mathrm{~m}), 444(\mathrm{~m})$.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

$$

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.054$
$w R\left(F^{2}\right)=0.127$
$S=1.10$
1937 reflections
150 parameters
0 restraints
Hydrogen site location: mixed
H atoms treated by a mixture of independent and constrained refinement
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}{ }^{2}\right)+(0.0426 P)^{2}+0.1904 P\right]$
where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\max }<0.001$
$\Delta \rho_{\text {max }}=0.17 \mathrm{e} \AA^{-3}$
$\Delta \rho_{\text {min }}=-0.16$ e $\AA^{-3}$
Extinction correction: SHELXL2013
(Sheldrick, 2008),
$\mathrm{Fc}^{*}=\mathrm{kFc}\left[1+0.001 \mathrm{xFc}^{2} \lambda^{3} / \sin (2 \theta)\right]^{-1 / 4}$
Extinction coefficient: 0.014 (2)

## Special details

Experimental. Spectroscopic data for HL2: ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , DMSO-d6; code $\mathrm{Hh} / \mathrm{NH}, \mathrm{Hl} / \mathrm{C} 3, \mathrm{Hn} / \mathrm{C} 1, \mathrm{Hm} / \mathrm{C} 2$, $\mathrm{Hb} / \mathrm{C} 11, \mathrm{Hd} / \mathrm{C} 9, \mathrm{Ha} / \mathrm{C} 11 /$, $\mathrm{He} / \mathrm{C} 8, \mathrm{Hg} / \mathrm{C} 6): 9.63$ (t, 1H, Jhg = 6.3, Hh); 9.21 (d, 1H, Jlm = 1.5, Hl); 8.90 (d, 1H, Jnm = $2.5, \mathrm{Hn}) ; 8.77(\mathrm{dd}, 1 \mathrm{H}, \mathrm{Jmn}=2.5, \mathrm{Jml}=1.5, \mathrm{Hm}) ; 8.49(\mathrm{dd}, 2 \mathrm{H}, \mathrm{Jba}=4.4, \mathrm{Jbe}=1.6, \mathrm{Hb}=\mathrm{Hd}) ; 7.31(\mathrm{dd}, 2 \mathrm{H}, \mathrm{Jab}=4.4$, $\mathrm{Jad}=1.6, \mathrm{Ha}=\mathrm{He}) ; 4.54(\mathrm{~d}, 2 \mathrm{H}, \mathrm{Jgh}=6.3, \mathrm{Hg}) .{ }^{13} \mathrm{C}$ NMR ( 400 MHz , DMSO-d6): 164.2, 150.4, 149.0, 148.5, 145.4, 144.5, 144.3, 123.0, 42.4. IR (KBr pellet, $\mathrm{cm}^{-1}$ ): 3366 (versus), 3089 (s), 3050 ( m ), 3031 ( s ), 2967 ( m ), 2935 ( s ), 1966 (w), 1924 (w), 1834 (w), 1674 (versus), 1634 (s), 1602 (versus), 1585 (s), 1564 (s) 1526 (versus), 1467 (versus), 1429 (versus), 1415 (versus), 1399 (versus), 1359 ( $s$ ), 1329 ( $s$ ), 1288 (versus), 1240 ( $m$ ), 1216 (versus), 1167 ( $s$ ), 1155 ( $s$ ), 1059 (versus), 1025 (versus), 1020 (versus), $993(s), 981(s), 968(s), 887(m), 870(s), 842(s), 832(s), 804$ (versus), 775 ( $s$ ), 731 ( m ), 652 (versus), $608(\mathrm{~s}), 517(\mathrm{~s}), 479(\mathrm{~m}), 445$ (versus), 411 ( m ).
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
