Edited by D.-J. Xu, Zhejiang University (Yuquan Campus), China

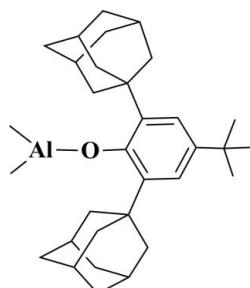

The title compound,  $[\text{Al}(\text{CH}_3)_2(\text{C}_{30}\text{H}_{41}\text{O})]$ , is synthesized by the reaction of 2,6-di-adamantyl-4-*tert*-butyl-phenol with  $\text{Al}(\text{CH}_3)_3$  in a nitrogen atmosphere. In the molecule, the coordination geometry around the  $\text{Al}^{\text{III}}$  atom is slightly distorted  $\text{C}_2\text{O}$  trigonal (the sum of the bond angles subtended at Al atom being  $359.9^\circ$ ), which is rarely reported for organometallic aluminium compounds. The coordination plane is approximately perpendicular to the benzene ring [the dihedral angle =  $87.73$  ( $16$ ) $^\circ$ ]. There is no intermolecular hydrogen bonding in the crystal structure.

**Keywords:** crystal structure; aluminium;  $\text{C}_2\text{O}$  trigonal coordination geometry; adamantyl-substituted phenol ligand.

**CCDC reference:** 1019044

## **Crystal structure of [2,6-bis(adamantan-1-yl)-4-*tert*-butylphenolato- $\kappa O$ ]di-methylaluminium(III)**

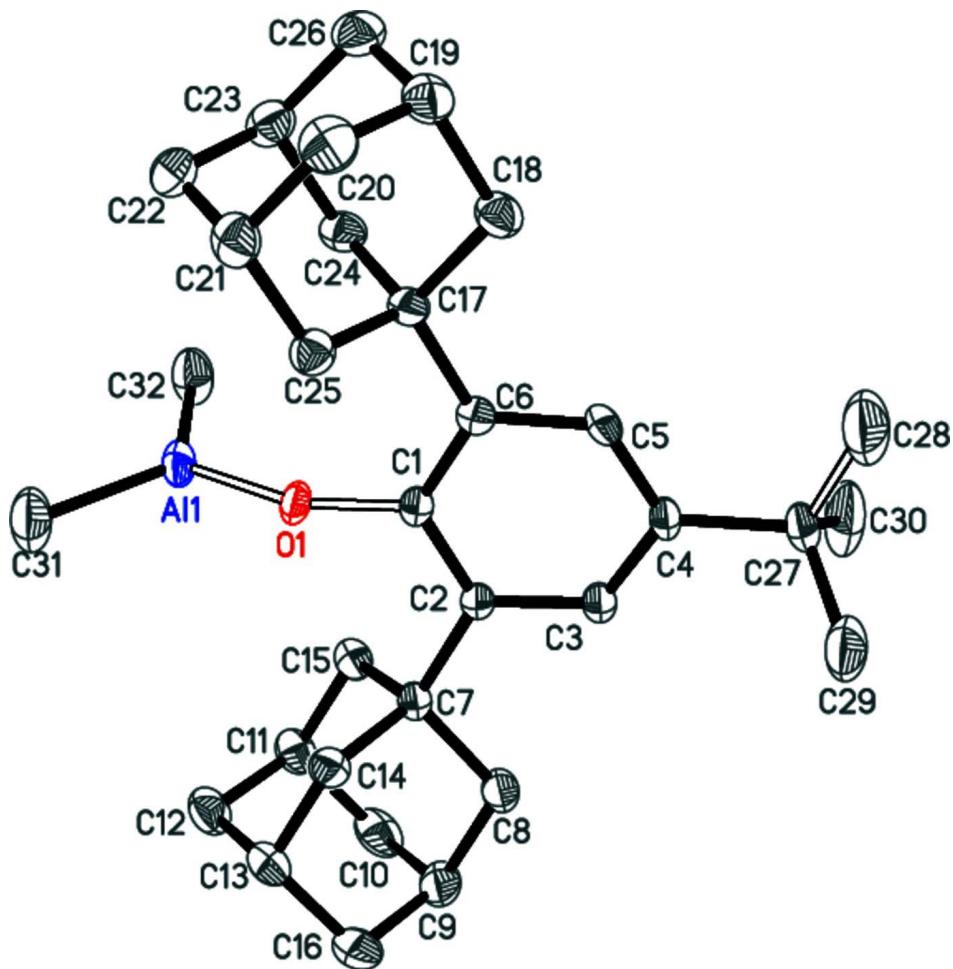

**Lei Wang and Li Yang**

### **S1. Experimental**

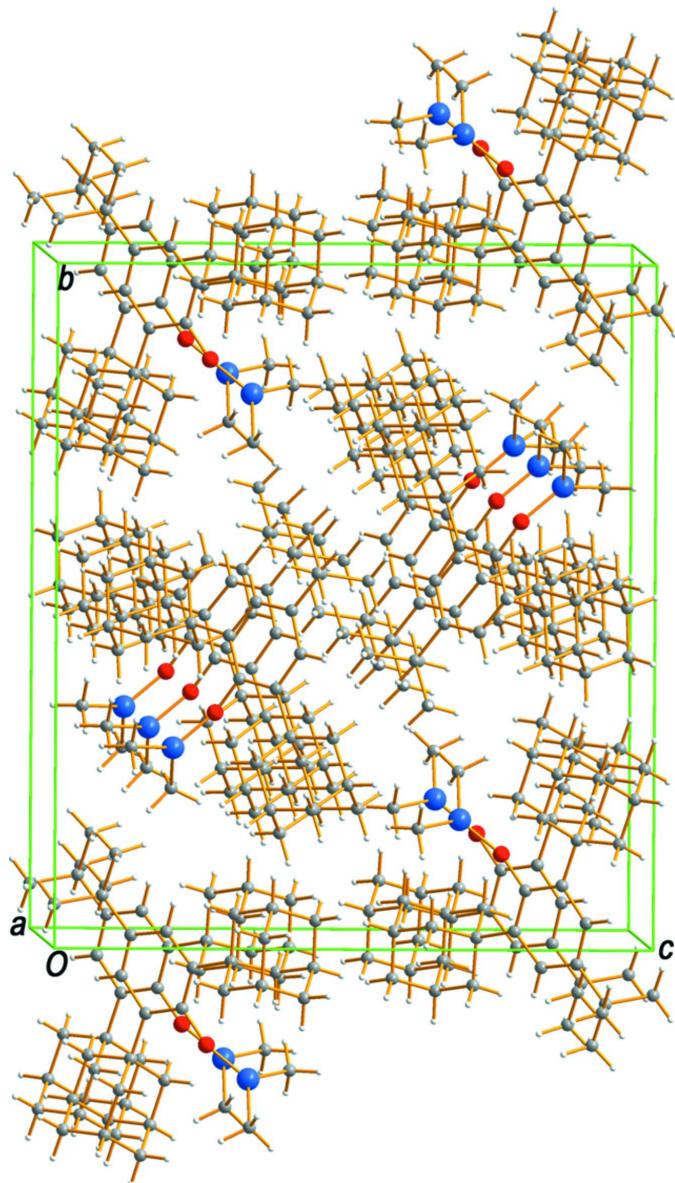

A hexane solution of Al(CH<sub>3</sub>)<sub>3</sub> (1.0 M, 1.1 mL, 1.1 mmol) was added dropwise to 2,6-di-adamantyl-4-*tert*-butyl-phenol (0.46g, 1.0 mmol) in THF (20 mL) at 273 K with stirring. The mixture was warmed up to 313 K and stirred for 4 h, and then the solution was filtered through celite. The filtrate was concentrated to ca. 10 mL and left at room temperature overnight, colorless crystals were obtained. The single crystals were gathered and isolated for studies. Yield: 0.29g (61%). <sup>1</sup>H NMR (298 K, CDCl<sub>3</sub>, 300 MHz, ppm):  $\delta$  7.11 (s, 2H, ArH), 2.16 (s, 12H, adamantyl), 2.03 (s, 6H, adamantyl), 1.78 (s, 12H, adamantyl), 1.28 (s, 9H, C(CH<sub>3</sub>)<sub>3</sub>), -0.65 (s, 6H, (CH<sub>3</sub>)<sub>2</sub>).

### **S2. Refinement**

H atoms were fixed geometrically and treated as riding with C–H = 0.93–0.97 Å, U<sub>iso</sub>(H) = 1.5U<sub>eq</sub>(C) for methyl H atoms and 1.2U<sub>eq</sub>(C) for the others.

**Figure 1**

An *ORTEP* view of the molecular structure of the title molecule with the atom-numbering. Displacement ellipsoids are drawn at 30%. The H atoms have been omitted for clarity.

**Figure 2**

Molecular packing of the title compound viewed along  $a$  axis.

 $\Delta\rho_{\text{min}} = -0.28 \text{ e } \text{\AA}^{-3}$

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
