Received 23 September 2014; accepted 26 September 2014

Edited by J. Simpson, University of Otago, New Zealand

In the molecule of the title compound, $\mathrm{C}_{7} \mathrm{H}_{9} \mathrm{ClN}_{2} \mathrm{O}_{2}$, the conformation is determined by intramolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds, which generate $S(6)$ and $S(5)$ ring motifs. The isopropyl group is almost perpendicular to the pyrimidine ring with torsion angles of -70.8 (3) and 56.0 (3) ${ }^{\circ}$. In the crystal, two inversion-related molecules are linked via a pair of $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds into $R_{2}^{2}(8)$ dimers; these dimers are connected into chains extending along the $b c$ plane via an additional $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bond and weaker $\mathrm{C}-$ $\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds. The crystal structure is further stabilized by a weak $\pi-\pi$ interaction [ 3.6465 (10) $\AA$ ] between adjacent pyrimidine-dione rings arranged in a head-to-tail fashion, producing a three-dimensional network.

Keywords: crystal structure; pyrimidine-2,4-dione; hydrogen bonds; $\pi-\pi$ interaction.

# Crystal structure of 6-chloro-5-isopropylpyrimidine-2,4(1H,3H)-dione 

Nadia G. Haress, Hazem A. Ghabbour, Ali A. El-Emam, C. S. Chidan Kumar and Hoong-Kun Fun

## S1. Comment

Pyrimidine-2,4-diones and their related derivatives have long been known for their diverse chemotherapeutic activities including antiviral activity against HIV (Miyasaka et al., 1989; Tanaka et al., 1995; Hopkins et al., 1996; El-Emam et al., 2004). In addition, potent anticancer activity was observed for several pyrimidine-2,4-diones (Klein et al., 2001; Nencka et al., 2006). In a continuation of our interest in the chemical and pharmacological properties of pyrimidine and uracil derivatives (Al-Omary et al., 2014; Haress et al., 2014, El-Brollosy et al., 2009), we have synthesized the title compound (I) as a precursor to the synthesis of a potential chemotherapeutic agent (Al-Turkistani et al., 2011).

In the title compound (Fig. 1), the molecular conformation is stabilized by intramolecular C6-H6B…O2 and C5$\mathrm{H} 5 \cdots \mathrm{Cl1}$ hydrogen bonds incorporating $S(6)$ and $S(5)$ ring motifs respectively (Bernstein et al., 1995). The isopropyl group is almost perpendicular to the $\mathrm{N} 1 / \mathrm{N} 2 / \mathrm{C} 1-\mathrm{C} 4$ ring with the $\mathrm{C} 3-\mathrm{C} 4-\mathrm{C} 5-\mathrm{C} 7$ and $\mathrm{C} 3-\mathrm{C} 4-\mathrm{C} 5-\mathrm{C} 6$ torsion angles of $-70.8(3)^{\circ}$ and $56.0(3)^{\circ}$ respectively. In the crystal structure, two adjacent molecules are linked via a pair of N2$\mathrm{H} 1 \mathrm{~N} 2 \cdots \mathrm{O} 2$ intermolecular hydrogen bonds forming inversion related $R_{2}{ }^{2}(8)$ dimers (Fig. 2).; these dimers are connected into chains via $\mathrm{N} 1-\mathrm{H} 1 \mathrm{~N} 1 \cdots \mathrm{O} 1$ and weak $\mathrm{C} 6-\mathrm{H} 6 \mathrm{~A} \cdots \mathrm{O} 1$ hydrogen bonds extending along the $b c$ plane. The crystal structure is further stabilized by a weak $\pi \cdots \pi$ interaction [3.6465 (10) $\AA$ ] producing a three-dimensional network.

## S2. Experimental

5-Isopropylbarbituric acid ( $8.51 \mathrm{~g}, 0.05 \mathrm{~mol}$ ) was added portionwise with stirring to a mixture of phosphorus oxychloride $(19.2 \mathrm{ml})$ and $N, N$-dimethyl aniline $(10.3 \mathrm{ml})$ over a period of 10 minutes. The mixture was then heated under reflux for one hour. On cooling, the mixture was poured onto crushed ice ( 200 g m ), stirred for 30 minutes and extracted with diethyl ether $(400 \mathrm{ml})$. The ethereal extract was dried over anhydrous sodium sulfate and evaporated under vacuum at room temperature to yield the intermediate 5 -isopropyl-2,4,6-trichloropyrimidine as a white waxy solid. $10 \%$ Sodium hydroxide ( 20 ml ) was then added to the intermediate and the mixture was heated under reflux for 30 minutes. On cooling, the mixture was acidified with hydrochloric acid to $\mathrm{pH} 1-2$ and the separated precipitate was filtered, washed with cold water and crystallized from ethanol to yield $6.98 \mathrm{~g}(74 \%)$ of the title compound $\left(\mathrm{C}_{7} \mathrm{H}_{9} \mathrm{ClN}_{2} \mathrm{O}_{2}\right)$ as colourless crystals. M.P.: $257-259{ }^{\circ} \mathrm{C}$.
${ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}, 500.13 \mathrm{MHz}\right): \delta 1.14\left(\mathrm{~d}, 6 \mathrm{H}, \mathrm{CH}_{3}, \mathrm{~J}=7.2 \mathrm{~Hz}\right), 2.51-2.63(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}), 11.22(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 11.79$
( $\mathrm{s}, 1 \mathrm{H}, \mathrm{NH}$ ). ${ }^{13} \mathrm{C}$ NMR ( $\mathrm{DMSO}_{\mathrm{d}}$, 125.76 MHz ): $\delta 20.02\left(\mathrm{CH}_{3}\right), 26.52(\mathrm{CH}), 113.95(\mathrm{C}-5), 140.95(\mathrm{C}-6), 149.75(\mathrm{C}=\mathrm{O})$, $162.75(\mathrm{C}=\mathrm{O})$.

## S3. Refinement

The nitrogen-bound H -atoms were located in a difference Fourier map and were refined freely [ $\mathrm{N}-\mathrm{H} 0.83$ (2) and 0.84 (3) $\AA]$. Other H atoms were positioned geometrically $(\mathrm{C}=\mathrm{H} 0.95-0.96 \AA)$ and refined using a riding model with $U_{\text {iso }}(\mathrm{H})=1.2$
$U_{\text {eq }}(\mathrm{C})$ or $1.5 U_{\mathrm{eq}}(\mathrm{C})$ for methyl H atoms. A rotating group model was used for the methyl groups.

## Figure 1

The molecular structure of the title compound with atom labels and $30 \%$ probability displacement ellipsoids.

## Figure 2

Crystal packing of the title compound, showing the hydrogen bonding interactions as dashed lines. H -atoms not involved in the hydrogen bonding are omited for clarity.

Extinction coefficient: 0.0181 (15)
```

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
