In the structure of the title salt,  $[Co(C_6H_6N_2)(H_2O)_2](H_2O)_2](BF_4)_2$ , the  $Co^{II}$  atom is located on an inversion centre. The transition metal is in a slightly distorted octahedral coordination environment, defined by the cyano N atoms of four hex-3-enedinitrile ligands in equatorial positions and the O atoms of two water molecules in axial positions. The bridging mode of the hex-3-enedinitrile ligands leads to the formation of cationic chains extending parallel to  $[1\bar{1}0]$ . The  $BF_4^-$  counter-anion is disordered over two sets of sites [occupancy ratio = 0.512 (19):0.489 (19)]. It is located in the voids between the cationic chains and is connected to the aqua ligands of the latter through O—H···F hydrogen bonds. One methylene H atom of the hex-3-enedinitrile ligand forms another and weak C—H···O hydrogen bond with a water O atom of a neighbouring chain, thus consolidating the three-dimensional network structure.

**Keywords:** crystal structure; cobalt; hex-3-enedinitrile; hydrogen bonding.

**CCDC reference:** 1401602

### 1. Related literature

Aliphatic dinitriles have gained much attention not only due to their rich coordination chemistry with transition-metal ions (Storhoff & Lewis, 1977; Heller & Sheldrick, 2004; Blount *et al.*, 1969), but also due to their applications as functional electrolyte additives for lithium ion batteries (Kim *et al.*, 2011, 2014*a,b*). While the coordination complexes of saturated aliphatic dinitrile ligands have been extensively studied (Storhoff & Lewis, 1977; Heller & Sheldrick, 2004; Blount *et al.*, 1969), those of unsaturated dinitrile ligands like in the title compound have hardly been reported so far.

## **Crystal structure of catena-poly[[[diaquacobalt(II)]-bis( $\mu$ -hex-3-enedinitrile- $\kappa^2N:N'$ )] bis(tetrafluoridoborate)]**

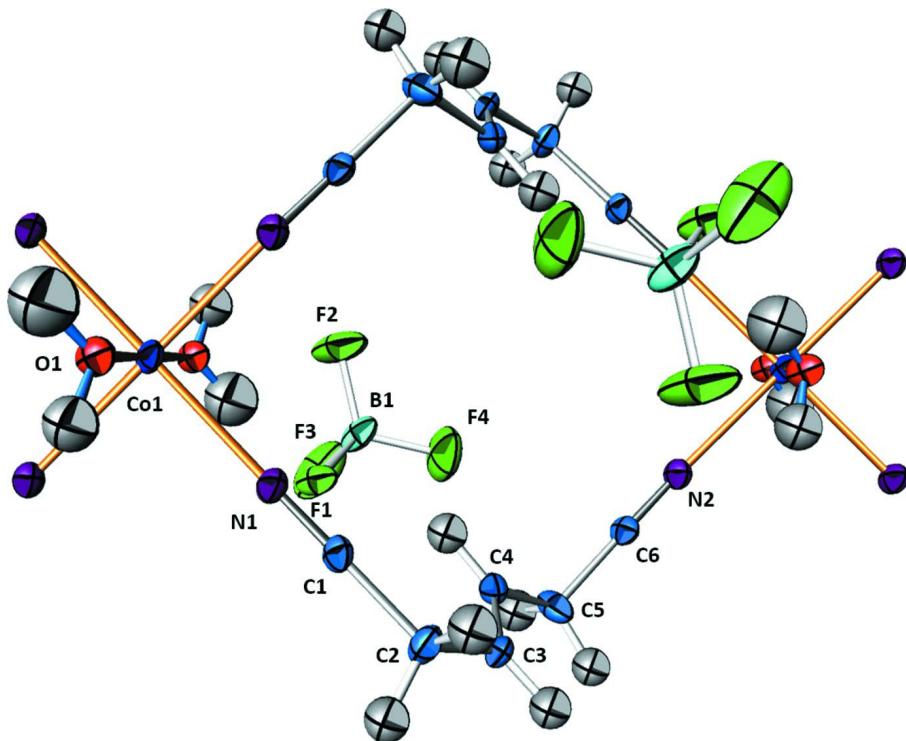

**Jung-Su Son, Sung-Chul Lim, Hochun Lee and Seung-Tae Hong**

### **S1. Experimental**

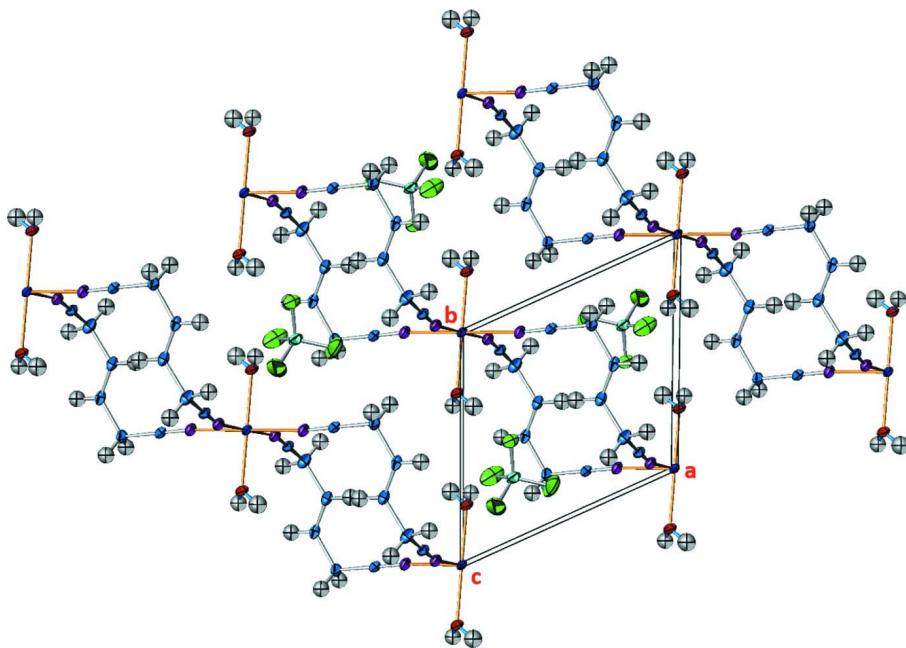

A solvent was prepared first by mixing ethylene carbonate (EC) and ethyl methyl carbonate (EMC) in an 1:2 volume ratio (3.3 ml and 6.6 ml, respectively). 0.934 g of lithium tetrafluoridoborate ( $LiBF_4$ ) were added to the solvent, and it was stirred for about 5 hours to dissolve the salt completely to form an 1M solution. 0.60 g (5 wt.%) of cobalt(II) tetrafluoridoborate hexahydrate and 0.24 g (2 wt.%) hex-3-enedinitrile were added and dissolved in the solution. The solution was kept for 48 hours in an argon-atmosphere glove-box at room temperature, resulting in the growth of red crystals. The crystals were washed with pure EMC solvent three times in the argon-atmosphere glove-box.

### **S2. Refinement**

H atoms attached to C atoms of the title compound were placed in geometrically idealized positions and treated as rigid bodies with C—H distances constrained to 0.92–0.97 Å. Water H atoms were located from a difference map and refined with a distance of 0.82 Å. The  $BF_4^-$  counter anion was refined with a positional disorder model where F2, F3 and F4 atoms are split into two positions while B1 and F1 atoms are not. Such a disorder model resulted in a slightly better refinement, reducing the  $R1$  factor values from 0.041 to 0.033.

**Figure 1**

The cationic chain structure of the title compound with displacement ellipsoids drawn at the 50% probability level. The  $\text{BF}_4^-$  anion is shown only with the major part of the disorder.

**Figure 2**

The crystal packing of the title compound with displacement ellipsoids drawn at the 50% probability level. The  $\text{BF}_4^-$  anion is shown only with the major part of the disorder. (Colour code: dark blue: Co, purple: N, blue: C, red: O, cyan: B, green: F, grey: H).

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles, and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
