Edited by M. Weil, Vienna University of Technology, Austria

The crystal structure of the title compound, cadmium sulfate monohydrate or poly[$(\mu_2\text{-aqua})(\mu_4\text{-sulfato})\text{cadmium}$], was redetermined based on modern CMOS (complementary metal oxide silicon) data. In comparison with the previous study [Bregeault & Herpin (1970). *Bull. Soc. Fr. Mineral. Cristallogr.* **93**, 37–42], all non-H atoms were refined with anisotropic displacement parameters and the hydrogen-bonding pattern unambiguously established due to location of the hydrogen atoms. In addition, a significant improvement in terms of precision and accuracy was achieved. In the crystal, the Cd^{2+} cation is coordinated by four O atoms of four sulfate anions and two O atoms of water molecules, forming a distorted octahedral $\text{trans-}[\text{CdO}_6]$ polyhedron. Each sulfate anion bridges four Cd^{2+} cations and each water molecule bridges two Cd^{2+} cations, leading to the formation of a three-dimensional framework, with $\text{Cd}\cdots\text{Cd}$ separations in the range 4.0757 (2)–6.4462 (3) \AA . O–H \cdots O hydrogen-bonding interactions of medium strength between the coordinating water molecules and sulfate anions consolidate the crystal packing.

Keywords: crystal structure; redetermination; cadmium sulfate monohydrate; hydrothermal synthesis; hydrogen bonding.

Crystal structure of $\text{CdSO}_4(\text{H}_2\text{O})$: a redetermination

Chatphorn Theppitak and Kittipong Chainok

S1. Synthesis and crystallization

The title compound was obtained serendipitously. $\text{CdSO}_4 \cdot 8/3\text{H}_2\text{O}$ (0.256 g, 1 mmol) and 3,6-di-2-pyridyl-1,2,4,5-tetrazine (0.236 g, 1 mmol) dissolved in water (5 ml) were added to a 23 ml Teflon-lined autoclave and heated at 356 K for 5 days. The product was collected by filtration, washed with water and air-dried. Colourless block-shaped crystals of the title compound suitable for X-ray analysis were isolated.

S2. Refinement

The same cell setting and atom numbering scheme as in the previous refinement (Bregeault & Herpin, 1970) were used. Starting coordinates for the atoms were also taken from the previous model. Hydrogen atoms of the water molecules were located from difference Fourier maps and were refined with an O—H distance restraint of 0.85 (2) Å.

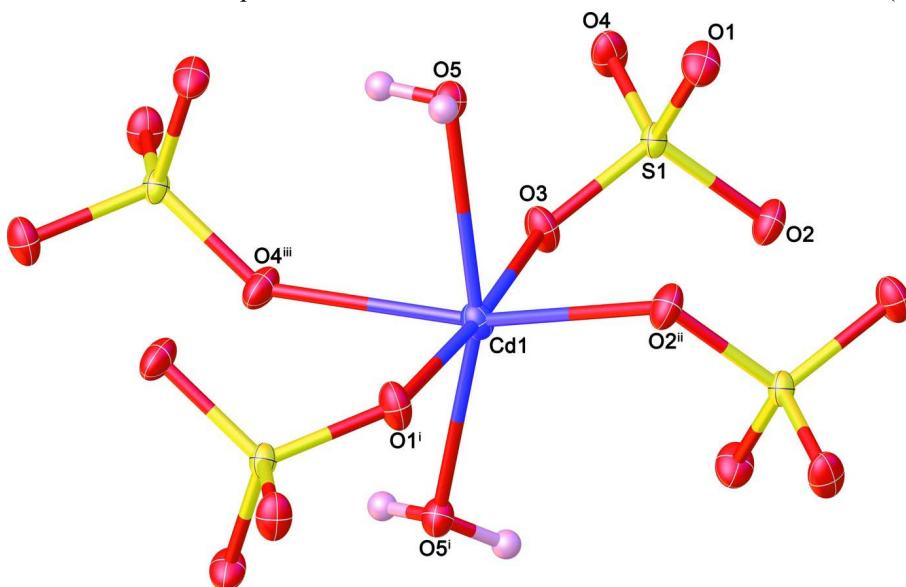

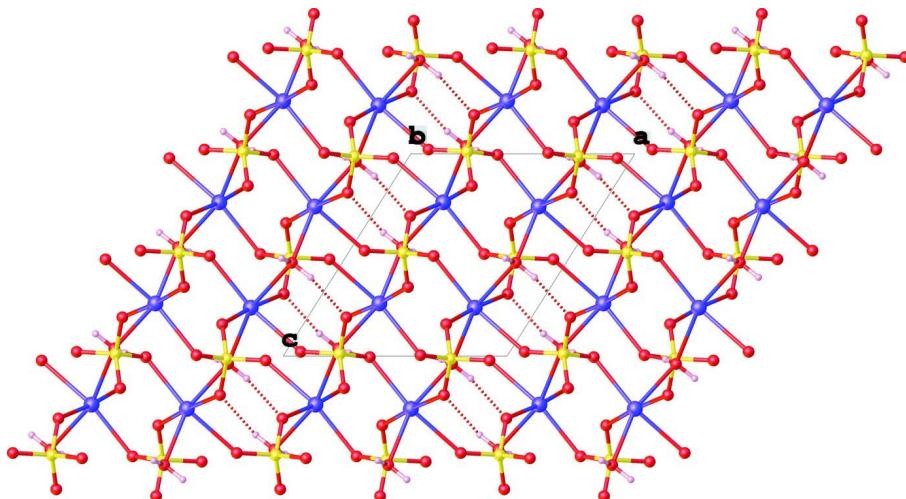

Figure 1

The coordination sphere around the Cd^{2+} cation with displacement ellipsoids drawn at the 50% probability level. [Symmetry codes: (i) x , $1/2 - y$, $1/2 + z$; (ii) $-x$, $1 - y$, $-z$; (iii) $1 - x$, $-1/2 + y$, $1/2 - z$].

 $w = 1/[\sigma^2(F_{\circ}^2) + (0.0107P)^2 + 0.2955P]$
where $P = (F_{\circ}^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} = 0.001$
 $\Delta\rho_{\max} = 0.28 \text{ e } \text{\AA}^{-3}$

$\Delta\rho_{\min} = -0.33 \text{ e } \text{\AA}^{-3}$

Special details

Experimental. SADABS was used for absorption correction. $wR2(\text{int})$ was 0.0449 before and 0.0357 after correction. The Ratio of minimum to maximum transmission is 0.9396. The $\lambda/2$ correction factor is 0.00150.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
