The title compound, $\{(C_7H_6NS)_2[Sb_2Cl_6O]\}_n$, contains two benzothiazolidium cations and one tri- μ -chlorido-trichlorido- μ -oxido-diantimonate(III) anion. The structure of the inorganic cation may be described as being built up from two polyhedra, *i.e.* a square-pyramidal $SbCl_4O$ and a distorted octahedral $SbOCl_5$ unit, sharing a common face (comprising the O atom and two Cl atoms). The two benzothiazole cations are quasi-planar and subtend a dihedral angle of 19.93 (5) $^\circ$. The crystal packing can be described by alternating (100) layers and [001] chains of the organic cations and inorganic anions connected through an extensive three-dimensional network of N–H \cdots Cl, C–H \cdots O and C–H \cdots Cl hydrogen bonds. This is consolidated by slipped π – π stacking, with centroid-to-centroid distances between the benzothiazole rings of 3.7111 (18)–3.8452 (16) Å. These interactions link the molecules within the layers and also link the layers together and reinforce the cohesion of the ionic structure.

1. Chemical context

The coordination chemistry of antimony has both a practical and theoretical interest (Abboud *et al.*, 2007; Bujak & Angel, 2006). Recently, the use of antimony complexes in cancer chemotherapy has become a topic of interest (Demicheli *et al.*, 2006; Rais *et al.*, 2000). As part of our ongoing studies of benzothiazole-based coordination networks (Bouchareb *et al.*, 2014), we now report the polymeric structure of new organic–inorganic hybrid compound $\{(C_7H_6NS)_2[Sb_2Cl_6O]\}_n$, (I).

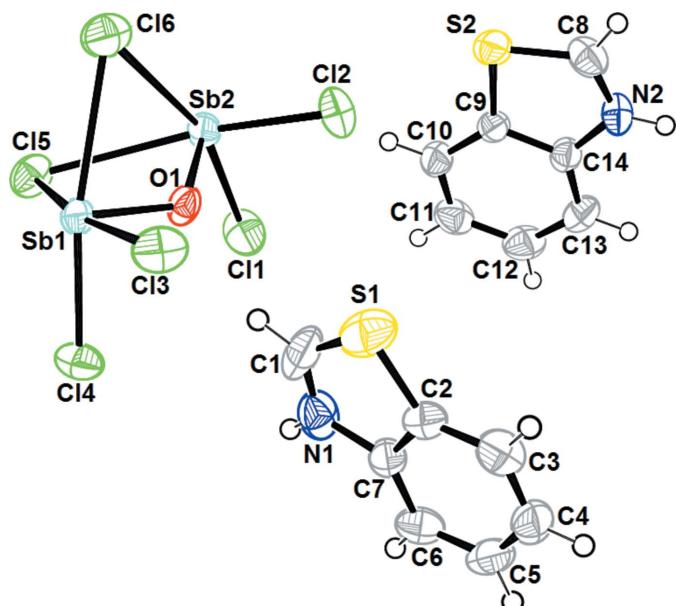

2. Structural commentary

The title compound contains two benzothiazolidium cations and one tri- μ -chlorido-trichlorido- μ -oxido-diantimonate(III) anion ($Sb_2Cl_6O^{2-}$). The molecular geometry and the atom-numbering scheme are shown in Fig. 1.

The structure of the inorganic anion may be described as two polyhedra, square-pyramidal $SbCl_4O$ and distorted octahedral $SbOCl_5$, sharing a common face (O1, Cl5 and Cl6). In

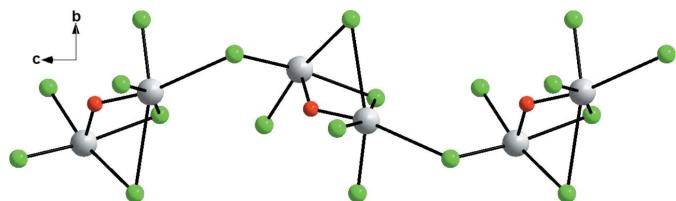

OPEN  ACCESS

**Figure 1**

The asymmetric unit of (I), showing the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level.

the first polyhedron, four Cl atoms (Cl3–Cl4–Cl5–Cl6) form a basal plane with the Sb1 atom lying 0.3011 (2) Å below the plane. The apical position is occupied by the O1 atom. In the second polyhedron, the O1 atom occupies the apical position and four Cl atoms (Cl1–Cl2–Cl5–Cl6) form the base equatorial plane with Sb2 displaced by 0.4168 (1) Å from it. The geometry of the Sb2 atom can be described as distorted octahedral, a sixth coordination is observed at a longer distance, with Sb2 coordinated by the adjacent Cl3ⁱ atom at a distance of 3.546 (4) Å [symmetry code: (i) $\frac{1}{2} - x, \frac{1}{2} + y, \frac{1}{2} - z$], forming an infinite chain parallel to [001] (Fig. 2). This distance is significantly shorter than the sum of the relevant van der Waals radii of 4.01 Å ($r_{\text{Sb}} = 2.1$ Å and $r_{\text{Cl}} = 1.91$ Å) and in good agreement with those found in $[\text{SbCl}_3(\text{C}_{25}\text{H}_{22}\text{O}_2\text{P}_2)]$ (Razak *et al.*, 1999) and in $[(\text{CH}_3)_2\text{NH}(\text{CH}_2)_2\text{NH}_3][\text{SbCl}_5]$ (Bujak & Angel, 2006). In this molecule, the angle between the two equatorial planes is 75.86 (2)°.

The Sb–O bridge distances of 1.9404 (16) and 1.9460 (17) Å are similar to those found in the $\text{Sb}_2\text{Cl}_6\text{O}_2$ moiety (Abboud *et al.*, 2007). Excluding the longest bond (Sb2–Cl3ⁱ), the terminal Sb–Cl bonds are in the range

**Figure 2**

Table 1
Hydrogen-bond geometry (Å, °).

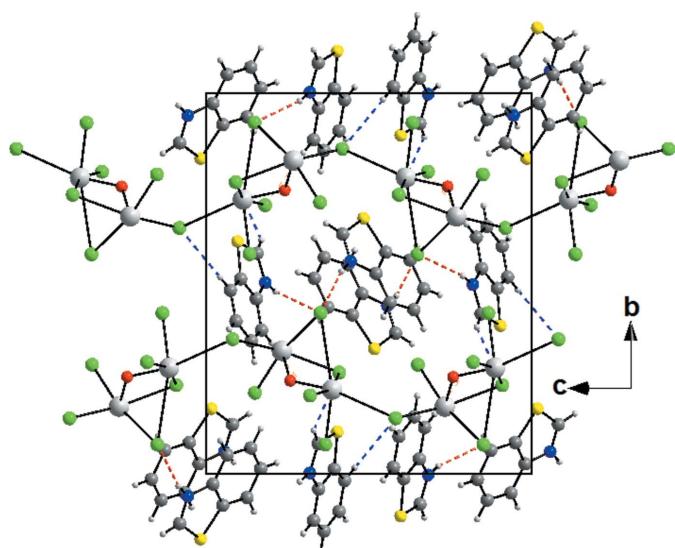

$D-\text{H}\cdots A$	$D-\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D-\text{H}\cdots A$
N1–H1N \cdots Cl6 ⁱ	0.86	2.37	3.200 (3)	162
N2–H2N \cdots Cl6 ⁱⁱ	0.86	2.35	3.145 (3)	153
C1–H1 \cdots O1	0.93	2.27	3.152 (4)	159
C8–H8 \cdots Cl5 ⁱⁱⁱ	0.93	2.72	3.327 (3)	124
C10–H10 \cdots Cl3 ^{iv}	0.93	2.78	3.612 (3)	150
C13–H13 \cdots Cl2 ⁱⁱ	0.93	2.76	3.524 (3)	140

Symmetry codes: (i) $-x, y - \frac{1}{2}, -z + \frac{3}{2}$; (ii) $-x + 1, y - \frac{1}{2}, -z + \frac{3}{2}$; (iii) $x + 1, y, z$; (iv) $x, -y + \frac{1}{2}, z - \frac{1}{2}$.

2.3974 (8)–2.4982 (8) Å and are shorter than the bridging bonds [2.7522 (8)–3.3244 (9) Å] and are in good agreement with those found in $\text{C}_{26}\text{H}_{28}\text{N}_8\text{O}_6\text{Sb}_4\text{Cl}_{10}$ (Abboud *et al.*, 2007). However, the Sb–O–Sb bond angle is 123.56 (9)° which is very different to that observed in $\text{Cs}_2\text{Sb}_2\text{O}_2(\text{OH})_8$ (Mikhaylov *et al.*, 2011) and the $\text{Sb}_2\text{Cl}_6\text{O}_2$ moiety (Abboud *et al.*, 2007). The dihedral angle between the mean planes of the two benzothiazole cations is 19.93 (5)°.

3. Supramolecular features

The crystal packing can be described by alternating (100) layers and [001] chains of organic cations and inorganic anions connected through an extensive network of N–H \cdots Cl, C–H \cdots O and C–H \cdots Cl hydrogen bonds, leading to the formation of a three-dimensional network (Table 1, Fig. 3). The packing is consolidated by slipped π – π stacking with centroid-to-centroid distances of 3.7111 (18)–3.8452 (16) Å between the benzothiazole rings. These interactions link the molecules within the layers and also link the layers together, reinforcing the cohesion of the ionic structure.

**Figure 3**

Part of diagram packing of the title compound, viewed along the a axis, showing alternating chains and layers connected by N–H \cdots Cl and C–H \cdots Cl hydrogen bonds (shown as dashed lines).

4. Synthesis and crystallization

A solution of SbCl_3 (45.6 mg, 0.2 mmol) in water (10 ml) was added dropwise to a solution of benzothiazole (0.5 ml, 4.6 mmol) in ethanol (10 ml). The mixture was then refluxed with stirring for 3 h and the resulting solution was left to stand at room temperature. Colorless crystals were obtained after several days.

5. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. Approximate positions for all H atoms were first obtained from the difference electron density map. However, the H atoms were placed into idealized positions and refined using the riding-atom approximation. The applied constraints were: C—H = 0.93 Å and N—H = 0.86 Å, $U_{\text{iso}} = 1.2U_{\text{eq}}$ (C or N).

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
