The protein tubulin is central for maintaining normal cellular processes, and molecules interfering with the tubulin dynamics have potential in the treatment of cancerous diseases. The title compound, $\mathrm{C}_{17} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{5}$, was prepared as a lead compound in a project dedicated to the development of therapeutic agents binding to the colchicine binding site on tubulin, thereby interfering with the cell division in cancer cells. It holds many of the main structural characteristics for colchicine binding and has the potential for further modification and functionalization. In the title molecule, the benzene ring is inclined to the quinoline ring by 76.10 (8) ${ }^{\circ}$. In the crystal, molecules are linked by two pairs of $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming tubular-like arrangements, propagating along the direction of the diagonals of the $a b$ plane, and enclosing $R_{2}^{2}(26)$ and $R_{2}^{2}(16)$ ring motifs.

## 1. Chemical context

Due to the elevated rate of cell division in cancer cells, agents targeting proteins central to the mitotic process are attractive for cancer treatment (Hanahan \& Weinberg, 2011). The protein tubulin polymerizes during the mitotic phase into microtubules, and this process is vital for the correct cell division (Parker et al., 2014). Based on the structures of the natural products colchicine and comberastatin A-4, a great amount of research on the synthesis and biological evaluation has been carried out (Lu et al., 2012). All these analogs bind to the colchicine binding site, and the pharmacophore and binding site is well known (Nguyen et al., 2005).

Despite large research efforts, many colchicine-binding drug candidates suffer from resistance and toxicity problems (Lu et al., 2012). Therefore, further exploration and biological evaluation of possible structures is needed. From another
medicinal chemistry project in our group, the title compound, (I), appeared as a side product in significant amounts. The structure was rationalized from NMR studies and confirmed by X-ray crystallography. Based on the literature and knowledge of the characteristics of molecules binding to the colchicine binding site on tubulin, it is reasonable that analogs

DAHWEO

(a)

(b)

Figure 1
(a) Schematic drawing of two analogues of (I) in the Cambridge Structural Database (CSD, Version 5.37; Groom et al., 2016) identified by their six-letter reference codes. (b) Number of entries in the CSD retrieved by using various search fragments. The raw quinolin-4( $1 H$ )-one skeleton (with potential substituents on all C and N atoms) yields 759 hits (including a small number of duplicates). Three types of specifications and combinations thereof are then explored: introduction of bonds to O atoms ( -OH , alkoxy or phenoxy) from C6 and C7, N1-substitution (blue, subset aromatic ring), and including only acyclic bonds from C2 and C3 atoms (red, $X=$ any atom type, subset H only). Green and violet colours indicate the two molecules in (a). (c) Final CSD search fragment used in the conformational analysis. Dashed bonds have bond type 'any', $\mathbf{Q}$ is $\mathbf{N}$ or C, $Z$ is 'not hydrogen', while T3 means the atom has three bonded atoms. The indicated torsion angle runs between the encircled atoms through the two ring centroids.

Table 1
Hydrogen-bond geometry $\left(\AA^{\circ},{ }^{\circ}\right)$.

| $D-\mathrm{H} \cdots A$ | $D-\mathrm{H}$ | $\mathrm{H} \cdots A$ | $D \cdots A$ | $D-\mathrm{H} \cdots A$ |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{C}^{\prime}-\mathrm{H}^{\prime} \cdots{ }^{\prime} \cdots 1^{\mathrm{i}}$ | 0.93 | 2.53 | $3.320(2)$ | 143 |
| ${\mathrm{C} 10-\mathrm{H} 103 \cdots 1^{\prime i i}}^{2}$ | 0.96 | 2.60 | $3.512(3)$ | 160 |

Symmetry codes: (i) $-x+1,-y+2,-z+1$; (ii) $-x,-y+1,-z+1$.
of this structure might be potent cytotoxic agents. The reported structure can easily be further modified to improve binding affinities in correspondence with reported structureactivity studies (Lai et al., 2011; Wang et al., 2013; Patil et al., 2012). Herein, we present the synthesis and the crystal structure of the title compound, 6,7-dimethoxy-1-(4-nitrophenyl)-quinolin-4(1H)-one (I).

## 2. Database survey

The frequencies of molecules in the Cambridge Structural Database (CSD, version 5.37; Groom et al., 2016) incorporating various modifications of the quinolin- $4(1 H)$-one fragment are shown in Fig. $1 b$. It can be seen that only one previous compound, 4-[6-methoxy-4-oxoquinolin-1(4H)yl]benzonitrile (CSD refcode PEBDIL; Hirano et al., 2008) share with (I) the lack of substituents at C2 and C3 as well as having an aromatic N -substituent, while 1-ethyl-1,4-dihydro-6,7-methylenedioxy-4-oxo-3-quinolinecarboxylic acid (CSD refcode DAHWEO; Cygler \& Huber, 1985) is alone in incorporating $\mathrm{C} 2-\mathrm{H}, \mathrm{C} 3-\mathrm{H}, \mathrm{C} 6-\mathrm{O}$ and $\mathrm{C} 7-\mathrm{O}$ bonds (Fig. 1a). Even though (I) is a rather simple covalent structure, it thus represents a rather unique combination of functionalities.

## 3. Structural commentary

The molecular structure of (I) is depicted in Fig. 2a, where the short, double-bond nature of the $\mathrm{C} 2=\mathrm{C} 3$ bond $[1.342$ (2) $\AA$ ] is clearly visible. While the bicyclic ring systems of DAHWOE and PEBDIL (Fig. 1a) are perfectly coplanar with the C6 and C 7 substituents as well as the $\mathrm{Cl}^{\prime}$-atom attached to N 1 , this is not the case for (I); the nitrobenzene ring is inclined to the quinoline ring system by $76.10(8)^{\circ}$, and the torsion angle defined by atom C 9 , the two ring centroids and atom $\mathrm{C} 1^{\prime}$ is $c a$ $167.7^{\circ}$; see Fig. $2 a$ and $2 b$. The more extended search fragment in Fig. $1 c$ found 157 such torsion angles in 62 CSD entries, and in only nine compounds does this torsion angle deviate by more than ca $13.3^{\circ}$ from planarity.

## 4. Supramolecular features

The reason for the unusual molecular conformation of (I) can be seen in Fig. $2 b$ and $2 c$, where close contacts to two neighbouring molecules are apparent; these force the methoxy group and the nitrophenyl group out of the quinolinone mean plane. In the crystal, molecules are linked by two pairs of C $\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming tubular-like arrangements

Figure 2
(a) The molecular structure of (I) with some selected bond lengths ( $\AA$; s.u.'s $=0.002 \AA$ ) at 295 K . Displacement ellipsoids are shown at the $50 \%$ probability level. Pink spheres are the centroids for the two six-membered rings, and the dashed green lines defines the torsion angle discussed in the text. (b) View along the centroid-centroid vector showing the torsion angle from (a) and two neighbouring molecules $A$ and $B$ at $(-x+1,-y+2,-z+1)$ and $(x-1, y, z)$, respectively. (c) As in (b), but rotated ca $27^{\circ}$ around the vertical axis to display two short intermolecular interactions involving the nitrophenyl substituent; $\mathrm{H}^{\prime} \cdots \mathrm{O} 1(-x+1,-y+2,-z+1)$ is $2.53 \AA$, while $\mathrm{H}^{\prime} \cdots \mathrm{C} 4 A(x-1, y, z)$ is $2.72 \AA$.
propagating along the direction of the diagonals of the $a b$ plane, and enclosing $R_{2}^{2}(26)$ and $R_{2}^{2}(16)$ ring motifs (Table 1 and Fig. 3). Within the tubular-like arrangements, molecules are also linked by offset $\pi-\pi$ interactions; the shortest interaction involves inversion-related pyridine rings with an intercentroid distance $C g 1 \cdots C g 1(-x+1,-y+2,-z+1)=$
3.659 (1) $\AA[C g 1$ is the centroid of the $\mathrm{N} 1 / \mathrm{C} 2-\mathrm{C} 4 / \mathrm{C} 4 A / \mathrm{C} 8 A$ ring; interplanar distance $=3.580$ (1) $\AA$, slippage $=0.754 \AA$ ] . The crystal density is comparatively high at $1.415 \mathrm{~g} \mathrm{~cm}^{-3}$, and no voids were calculated by Mercury (Macrae et al., 2008) using the default settings (probe radius $1.2 \AA$, grid spacing $0.7 \AA$ ).

Figure 3
A viewed along the normal to (110) of the crystal packing of compound (I). Hydrogen bonds are shown as dashed lines (see Table 1). For clarity, only H atoms, $\mathrm{H} 2^{\prime}$ and H 103 , have been included.

## 5. Synthesis and crystallization

$\mathrm{Cs}_{2} \mathrm{CO}_{3}(0.212 \mathrm{~g}, 0.65 \mathrm{mmol})$ and 6,7-dimethoxyquinolin-4-ol $(67 \mathrm{mg}, 0.326 \mathrm{mmol})$ were weighed out in a round-bottom flask, to which was added 3 ml DMF and 1 ml MeCN . The mixture was then stirred for 15 min . 1-Fluoro-4-nitrobenzene ( $101 \mathrm{mg}, 0.716 \mathrm{mmol}$ ) in $2 \mathrm{ml} 1: 1 \mathrm{DMF}: \mathrm{MeCN}$ was then added, and the reaction mixture was stirred for 20 h at 328 K . The crude product was washed with water $(4 \times 10 \mathrm{ml})$ and brine $(10 \mathrm{ml})$, and then purified by column chromatography [Hep:EtOAc (4:1) $\rightarrow$ Hep:EtOAc:MeOH (10:10:1)]. The title compound (I) was obtained as a yellow solid ( $40 \mathrm{mg}, 38 \%$ ). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta 8.48(d, 2 \mathrm{H}, J=8.8 \mathrm{~Hz}), 7.79(s$, $1 \mathrm{H}), 7.67(d, 2 \mathrm{H}, J=8.8 \mathrm{~Hz}), 7.48(d, 1 \mathrm{H}, J=7.8 \mathrm{~Hz}), 6.35(d$,
$1 \mathrm{H}, J=7.7 \mathrm{~Hz}), 6.32(s, 1 \mathrm{H}), 3.98(s, 3 \mathrm{H}), 3.72(s, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{CDCl}_{3}, 101 \mathrm{MHz}\right): \delta 176.98,153.56,147.96,147.71$, 146.91, 140.54, 136.08, 128.64, 125.92, 120.99, 110.68, 106.17, 98.10, 56.46, 56.21. HRMS (ESI $) ~ m / z$ calculated for $\mathrm{C}_{17} \mathrm{H}_{15} \mathrm{~N}_{2} \mathrm{O}_{5}[M+\mathrm{H}]^{+}: 327.0975$, found 327.0976 . Yellow crystals of compound (I) were grown from a heptane:EtOAc:MeOH (10:10:1) solution by slow evaporation of the solvent.

## 6. 1 Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The H atoms were included in calculated positions and treated as riding: $\mathrm{C}-\mathrm{H}=0.93-0.96 \AA$ with $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}($ C-methyl $)$ and $1.2 U_{\text {eq }}(\mathrm{C})$ for other H atoms.

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
