The asymmetric unit of the title complex, $[Cd(C_{10}H_{11}O_2)_2(C_6H_6N_2O)_2(H_2O)]$, contains one half of the complex molecule, with the Cd^{II} cation and the coordinated water O atom residing on a twofold rotation axis. The Cd^{II} cation is coordinated in a bidentate manner to the carboxylate O atoms of the two symmetry-related 2,4,6-trimethylbenzoate (TMB) anions and to the water O atom at distances of 2.297 (2), 2.527 (2) and 2.306 (3) Å to form a distorted pentagonal arrangement, while the distorted pentagonal-bipyramidal coordination sphere is completed by the two pyridine N atoms of the two symmetry-related monodentate nicotinamide (NA) ligands at distances of 2.371 (3) Å in the axial positions. In the crystal, molecules are linked via intermolecular N—H···O, O—H···O and C—H···O hydrogen bonds with $R_2^2(12)$, $R_3^3(8)$, $R_3^3(14)$, $R_3^3(16)$, $R_3^3(20)$, $R_3^3(22)$, $R_4^4(22)$, $R_5^5(16)$, $R_6^6(16)$ and $R_6^6(18)$ ring motifs, forming a three-dimensional architecture. The Hirshfeld surface analysis of the crystal structure indicates that the most important contributions for the crystal packing are H···H (56.9%), H···C/C···H (21.3%) and H···O/O···H (19.0%) interactions.

1. Chemical context

Nicotinamide (NA) is one form of niacin. A deficiency of this vitamin leads to loss of copper from the body, known as pellagra disease. Victims of pellagra show unusually high serum and urinary copper levels (Krishnamachari, 1974). The crystal structure of NA was first determined by Wright & King (1954). The NA ring is the reactive part of nicotinamide adenine dinucleotide (NAD) and its phosphate (NADP), which are the major electron carriers in many biological oxidation-reduction reactions (You *et al.*, 1978). The nicotinic acid derivative *N,N*-diethylnicotinamide (DENA) is an important respiratory stimulant (Bigoli *et al.*, 1972).

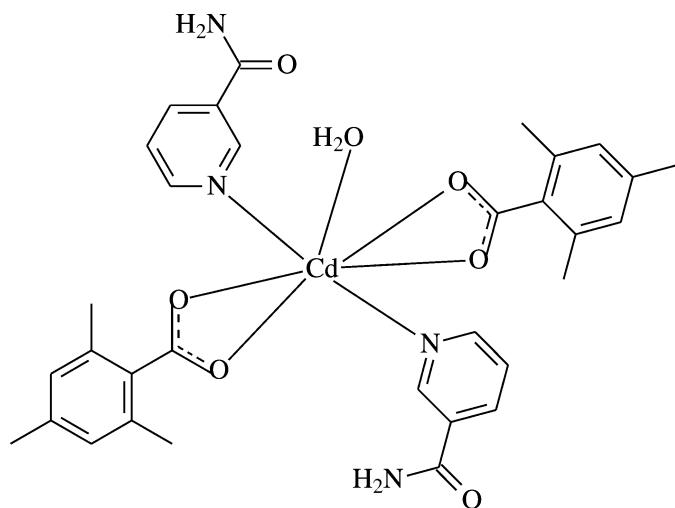

Transition metal complexes with ligands of biochemical interest such as imidazole and some N-protected amino acids show interesting physical and/or chemical properties, through which they may find applications in biological systems (Antolini *et al.*, 1982). Crystal structures of metal complexes with benzoic acid derivatives have been reported extensively because of the varieties of the coordination modes. For example, Co and Cd complexes with 4-aminobenzoic acid (Chen & Chen, 2002), Co complexes with benzoic acid (Catterick *et al.*, 1974), 4-nitrobenzoic acid (Nadzhafov *et al.*, 1981) and phthalic acid (Adiwidjaja *et al.*, 1978), and Cu complexes with 4-hydrochloric acid (Shnulin *et al.*, 1981) have been described.

OPEN ACCESS

The structure–function–coordination relationships of the arylcarboxylate ion in Cd^{II} complexes of benzoic acid derivatives change depending on the nature and position of the substituted groups on the benzene ring, the nature of the additional ligand molecule or solvent, and the pH and temperature of synthesis (Shnulin *et al.*, 1981). When pyridine and its derivatives are used instead of water molecules, the structure is completely different (Catterick *et al.*, 1974).

The structures of some mononuclear complexes obtained from the reactions of transition metal(II) ions with nicotinamide (NA) and some benzoic acid derivatives as ligands have been determined previously, *e.g.* [Zn(C₇H₅O₃)₂(C₆H₆N₂O)₂] [(II); Necefoğlu *et al.*, 2002], [Mn(C₇H₄ClO₂)₂(C₁₀H₁₄N₂O)₂·(H₂O)₂] [(III); Hökelek *et al.*, 2008], [Zn(C₈H₈NO₂)₂(C₆H₆N₂O)₂]·H₂O [(IV); Hökelek *et al.*, 2009a], [Mn(C₉H₁₀NO₂)₂·(C₆H₆N₂O)(H₂O)₂] [(V); Hökelek *et al.*, 2009b] and [Co(C₉H₁₀NO₂)₂(C₆H₆N₂O)(H₂O)₂] [(VI); Hökelek *et al.*, 2009c]. The structure determination of the title compound, (I), a cadmium complex with two 2,4,6-trimethylbenzoate (TMB) and two nicotinamide (NA) ligands and one coordinated water molecule, was undertaken in order to compare the results obtained with those reported previously. In this context, we synthesized the Cd^{II}-containing title compound and report herein its crystal and molecular structures along with the Hirshfeld surface analysis.

2. Structural commentary

The asymmetric unit of the crystal structure of the mononuclear title complex contains half of a Cd^{II} cation (site symmetry 2), one 2,4,6-trimethylbenzoate (TMB) anion and one nicotinamide (NA) molecule together with half of a water molecule (point group symmetry 2), the TMB and NA ligands coordinating in bidentate and monodentate manners, respectively (Fig. 1).

The Cd^{II} cation is coordinated bidentately to the carboxylate O atoms (O1, O2, O1ⁱ and O2ⁱ) of two symmetry-related 2,4,6-trimethylbenzoate (TMB) anions and to the water O atom (O4) at distances of 2.297 (2), 2.527 (2) and 2.306 (3) Å, respectively, to form a distorted pentagonal

arrangement. The sum of the bond angles O1–Cd1–O1ⁱ [87.57 (11)^o], O1–Cd1–O2 [53.63 (7)^o], O1ⁱ–Cd1–O2ⁱ [53.63 (7)^o], O2–Cd1–O4 [84.47 (5)^o] and O2ⁱ–Cd1–O4 [84.47 (5)^o] in the basal plane around Cd^{II} cation is 363.77^o [symmetry code: (i) 1 – x, y, $\frac{1}{2}$ – z]. This confirms the presence of the Cd^{II} cation with a small deviation from the basal plane. The distorted pentagonal–bipyramidal coordination sphere is completed by the two pyridine N atoms (N1 and N1ⁱ) of the two symmetry-related monodentate nicotinamide (NA) ligands at distances of 2.371 (3) Å in the axial positions (Fig. 1).

The near equalities of the C1–O1 [1.249 (4) Å] and C1–O2 [1.253 (3) Å] bonds in the carboxylate groups indicate delocalized bonding arrangements, rather than localized single and double bonds. The O2–C1–O1 bond angle [121.7 (3)^o] seems to be slightly decreased than that present in a free acid [122.2^o]. The O2–C1–O1 bond angle may be compared with the corresponding values of 123.5 (2) and 120.4 (2)^o in (II), 125.2 (5)^o in (III), 119.2 (3) and 123.8 (2)^o in (IV), 123.6 (3) and 119.4 (3)^o in (V) and 123.86 (13) and 118.49 (14)^o in (VI), where the benzoate ions are coordinated to the metal atoms only monodentately in (III), and both monodentately and bidentately in (II), (IV), (V) and (VI). The Cd1 atom lies 0.0192 (1) Å above of the planar (O1/O2/C1) carboxylate group. The O1–Cd1–O2 angle is 53.63 (7)^o. The corresponding O–M–O angles are 58.79 (6)^o in (II), 59.02 (8)^o in (IV), 58.45 (9)^o in (V) and 60.70 (4)^o in (VI). In the TMB anion, the carboxylate group is twisted away from the attached benzene ring, A (C2–C7), ring by 60.94 (18)^o, while the benzene and pyridine rings [pyridine = B (N1/C11–C15)], are oriented at a dihedral angle of 50.32 (11)^o. The four-membered ring D (Cd1/O1/O2/C1) is nearly planar with a maximum deviation of 0.0029 (30) Å (for C1) from the mean plane, and it is oriented at dihedral angles of 60.98 (11) and 81.91 (7)^o, with respect to the A and B rings.

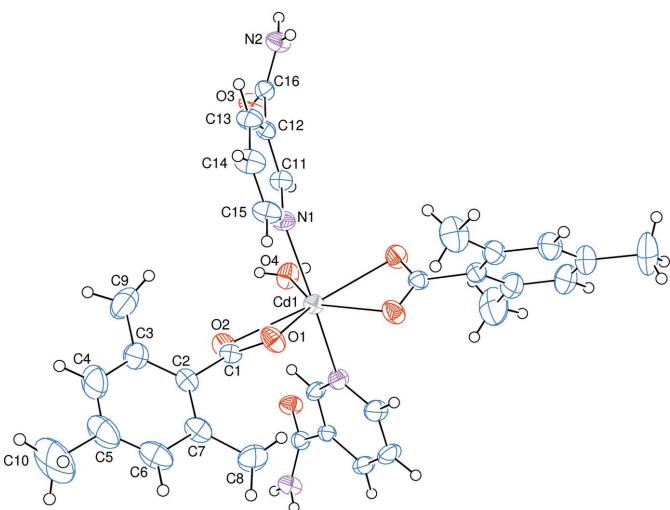

Figure 1

The molecular structure of the title complex with the atom-numbering scheme. Unlabelled atoms are related to labelled atoms by the symmetry operation (1 – x, y, $\frac{1}{2}$ – z). Displacement ellipsoids are drawn at the 50% probability level.

Table 1
Hydrogen-bond geometry (\AA , $^\circ$).

$D-\text{H}\cdots A$	$D-\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D-\text{H}\cdots A$
$\text{N}2-\text{H}2A\cdots\text{O}3^{\text{vi}}$	0.89 (3)	2.26 (4)	3.047 (4)	147 (3)
$\text{N}2-\text{H}2B\cdots\text{O}2^{\text{vii}}$	0.81 (3)	2.03 (3)	2.830 (4)	168 (4)
$\text{O}4-\text{H}41\cdots\text{O}3^{\text{iii}}$	0.80 (3)	1.92 (3)	2.714 (3)	170 (3)
$\text{C}8-\text{H}8C\cdots\text{O}1^{\text{viii}}$	0.96	2.55	3.468 (5)	161

Symmetry codes: (iii) $-x+1, -y+2, -z+1$; (vi) $x, -y+2, z+\frac{1}{2}$; (vii) $x, y, z+1$; (viii) $x, -y+1, z-\frac{1}{2}$.

3. Supramolecular features

In the crystal, the molecules are linked via intermolecular $\text{N}-\text{H}_{\text{NA}}\cdots\text{O}_{\text{NA}}$, $\text{N}-\text{H}_{\text{NA}}\cdots\text{O}_C$, $\text{O}-\text{H}_W\cdots\text{O}_{\text{NA}}$ and $\text{C}-\text{H}_{\text{TMB}}\cdots\text{O}_C$ (NA = nicotinamide, C = carboxylate, W = water and $\text{TMB} = 2,4,6$ -trimethylbenzoate) hydrogen bonds (Table 1) with $R_2^2(12)$, $R_3^2(8)$, $R_3^2(14)$, $R_3^2(16)$, $R_3^2(20)$, $R_3^2(22)$, $R_4^4(22)$, $R_5^5(16)$, $R_6^6(16)$ and $R_6^6(18)$ ring motifs (Fig. 2), forming a three-dimensional architecture. Hydrogen-bonding and van der Waals contacts are the dominant interactions in the crystal packing. No significant $\pi-\pi$ or $\text{C}-\text{H}\cdots\pi$ interactions are observed.

4. Hirshfeld surface analysis

Visualization and exploration of intermolecular close contacts of a structure is invaluable, and this can be achieved using Hirshfeld surface (HS) analysis (Hirshfeld, 1977; Spackman & Jayatilaka, 2009). An HS analysis was carried out by using *CrystalExplorer17.5* (Turner *et al.*, 2017) to investigate the locations of atom–atom short contacts with the potential to form hydrogen bonds and the quantitative ratios of these

Table 2
Selected interatomic distances (\AA).

$\text{O}1\cdots\text{H}8C^{\text{i}}$	2.55	$\text{N}2\cdots\text{H}13$	2.75
$\text{O}2\cdots\text{H}2B^{\text{ii}}$	2.03 (3)	$\text{C}6\cdots\text{H}14^{\text{ii}}$	2.80
$\text{O}3\cdots\text{H}41^{\text{iii}}$	1.92 (3)	$\text{C}16\cdots\text{H}41^{\text{iii}}$	2.85 (3)
$\text{O}3\cdots\text{H}2A^{\text{iv}}$	2.26 (4)	$\text{H}8A\cdots\text{H}8A^{\text{v}}$	2.54

Symmetry codes: (i) $x, -y+1, z+\frac{1}{2}$; (ii) $x, y, z-1$; (iii) $-x+1, -y+2, -z+1$; (iv) $x, -y+2, z-\frac{1}{2}$; (v) $-x+1, -y+1, -z$.

interactions and the π -stacking interactions in the crystal structure of the title complex.

In the HS plotted over d_{norm} (Fig. 3), the white surface indicates contacts with distances equal to the sum of van der Waals radii, and the red and blue colours indicate distances shorter (in close contact) or longer (distinct contact) than the van der Waals radii, respectively (Venkatesan *et al.*, 2016). The bright-red spots appearing near $\text{NA}-\text{O}3$, $\text{TMB}-\text{O}1$ and $\text{O}2$, and hydrogen atoms $\text{H}2A$, $\text{H}2B$, $\text{H}41$ and $\text{H}8C$ indicate their role as the respective donors and acceptors in the dominant $\text{O}-\text{H}\cdots\text{O}$, $\text{N}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds; they also appear as blue and red regions corresponding to positive and negative potentials on the HS mapped over electrostatic potential (Spackman *et al.*, 2008; Jayatilaka *et al.*, 2005) as shown in Fig. 4. The blue regions indicate the positive electrostatic potential (hydrogen-bond donors), while the red regions indicate the negative electrostatic potential (hydrogen-bond acceptors). The shape-index of the HS is a tool to visualize the $\pi-\pi$ stacking by the presence of adjacent red and blue triangles; if there are no adjacent red and/or blue

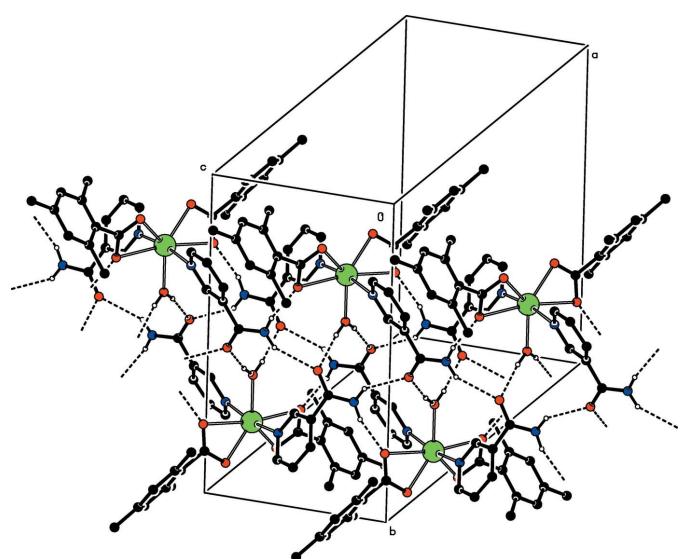

Figure 2

Part of the crystal structure. $\text{O}-\text{H}_W\cdots\text{O}_{\text{NA}}$, $\text{N}-\text{H}_{\text{NA}}\cdots\text{O}_C$ and $\text{N}-\text{H}_{\text{NA}}\cdots\text{O}_{\text{NA}}$ (W = water, C = carboxylate and NA = nicotinamide) hydrogen bonds, enclosing $R_2^2(12)$, $R_3^2(8)$, $R_3^2(14)$, $R_3^2(16)$, $R_3^2(20)$, $R_3^2(22)$, $R_4^4(22)$, $R_5^5(16)$, $R_6^6(16)$ and $R_6^6(18)$ ring motifs are shown as dashed lines. C-bound H atoms have been omitted for clarity.

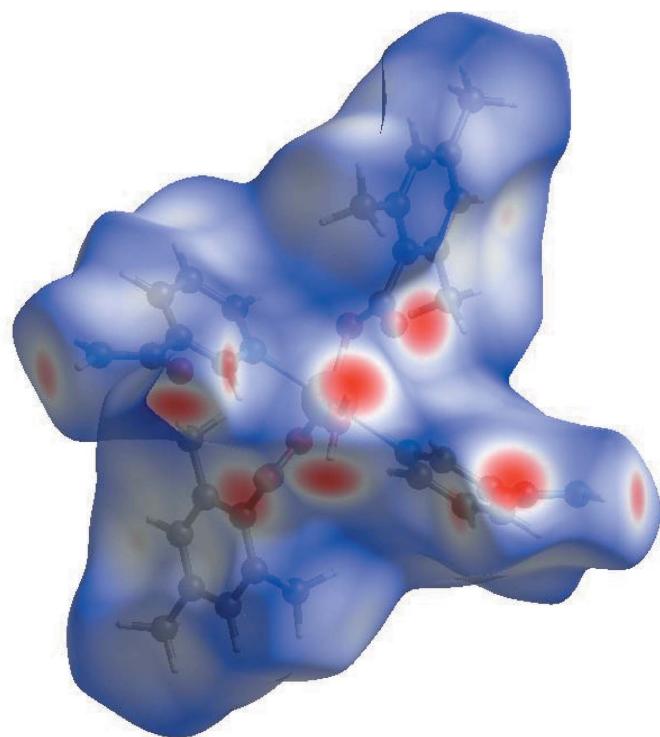

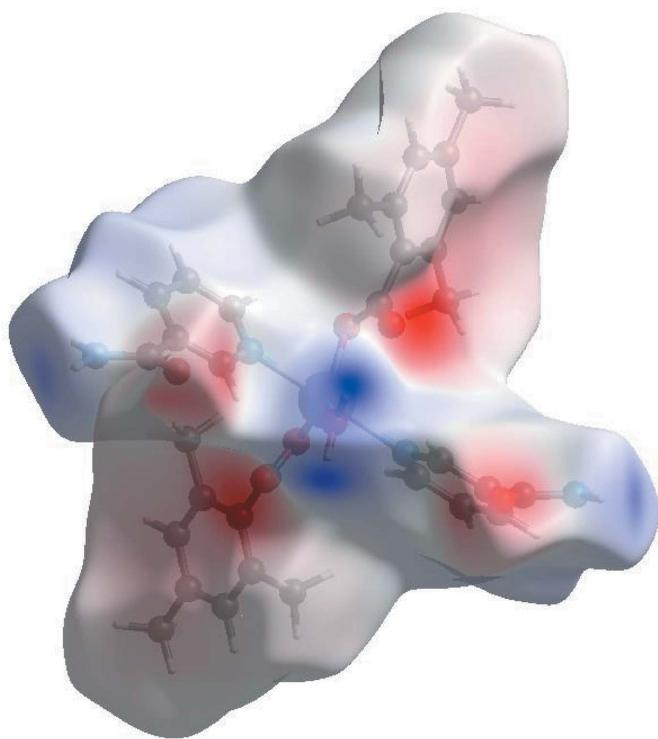

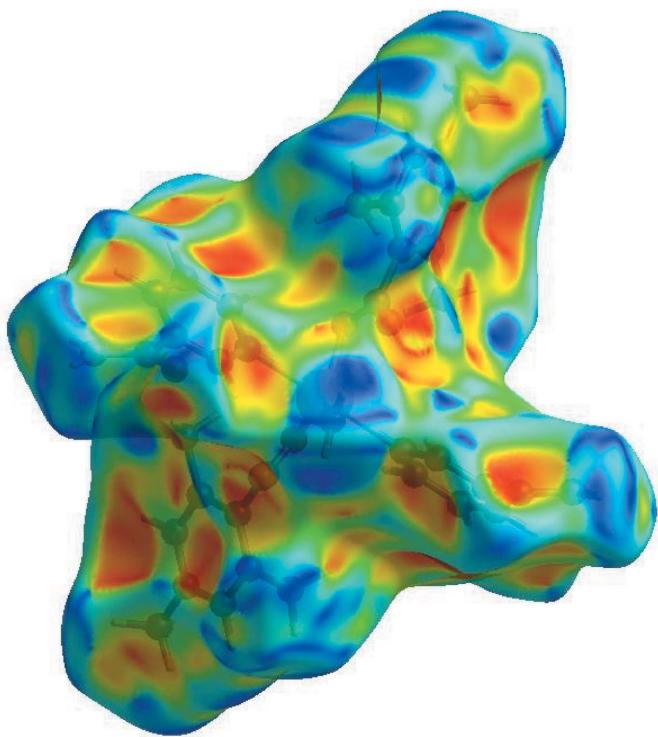

Figure 3

View of the three-dimensional Hirshfeld surface of the title complex plotted over d_{norm} in the range -0.6741 to 1.6440 a.u.

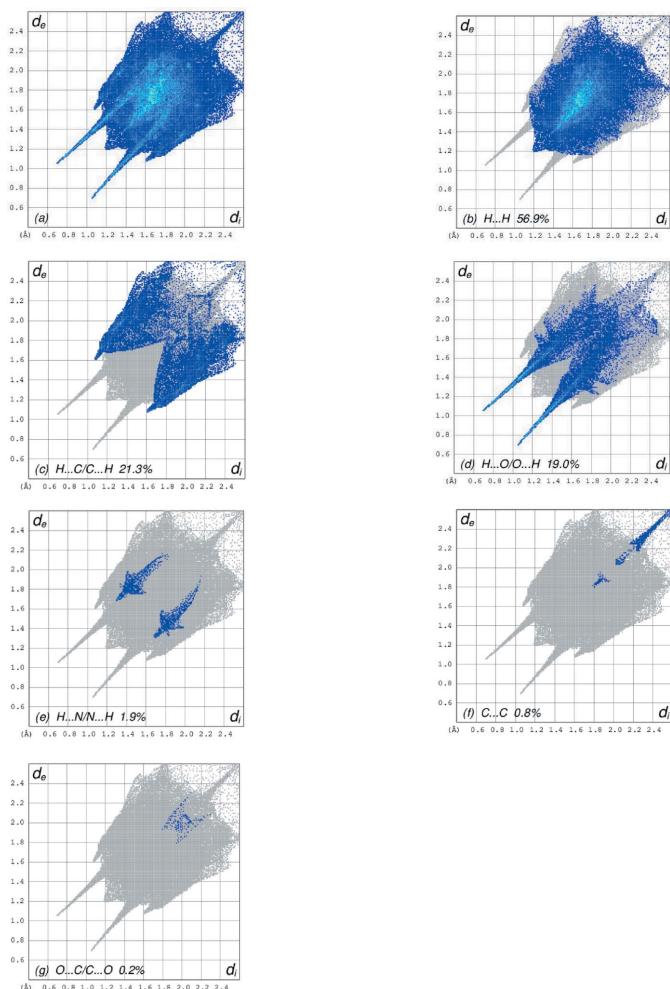

**Figure 4**

View of the three-dimensional Hirshfeld surface of the title complex plotted over electrostatic potential energy in the range -0.1379 to 0.1988 a.u. using the STO-3G basis set at the Hartree–Fock level of theory. The $\text{N}-\text{H}\cdots\text{O}$, $\text{O}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{O}$ hydrogen-bond donors and acceptors are viewed as blue and red regions around the atoms corresponding to positive and negative potentials, respectively.

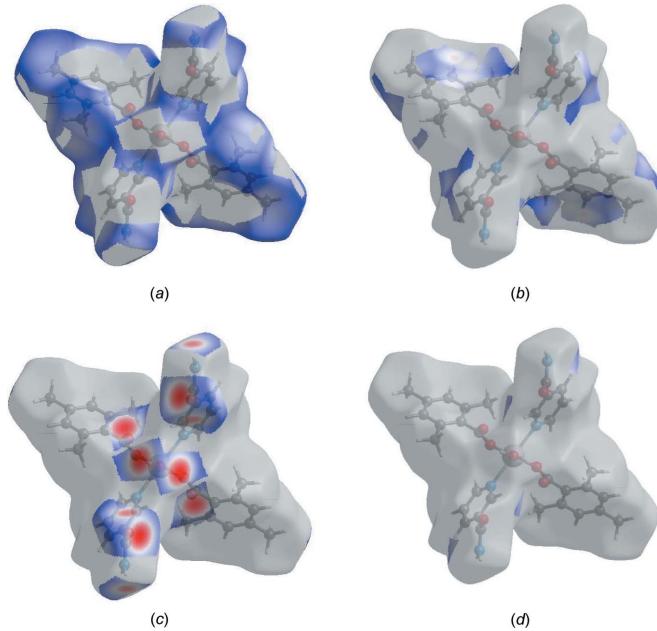

**Figure 5**
Hirshfeld surface of the title complex plotted over shape-index.

triangles, then there are no $\pi-\pi$ interactions. Fig. 5 clearly suggests that there are no $\pi-\pi$ interactions in (I).

The overall two-dimensional fingerprint plot, Fig. 6*a*, and those delineated into $\text{H}\cdots\text{H}$, $\text{H}\cdots\text{C/C}\cdots\text{H}$, $\text{H}\cdots\text{O/O}\cdots\text{H}$, $\text{H}\cdots\text{N/N}\cdots\text{H}$, $\text{C}\cdots\text{C}$ and $\text{O}\cdots\text{C/C}\cdots\text{O}$ contacts (McKinnon *et al.*, 2007) are illustrated in Fig. 6*b–g*, respectively, together with their relative contributions to the Hirshfeld surface. The most important interaction is $\text{H}\cdots\text{H}$, contributing 56.9% to the overall crystal packing, which is reflected in Fig. 6*b* as widely scattered points of high density due to the large hydrogen content of the molecule. The single spike in the centre at $d_e = d_i = 1.2$ Å in Fig. 6*b* is due to a short interatomic $\text{H}\cdots\text{H}$ contact (Table 2). In the absence of $\text{C}-\text{H}\cdots\pi$ interactions in the crystal, the pair of characteristic wings resulting in the fingerprint plot delineated into $\text{H}\cdots\text{C/C}\cdots\text{H}$ contacts, with 21.3% contribution to the HS, Fig. 6*c*; the pair of thin edges at $d_e + d_i \sim 1.67$ Å result from short interatomic $\text{H}\cdots\text{C/C}\cdots\text{H}$ contacts (Table 2). In the fingerprint plot delineated into $\text{H}\cdots\text{O/O}\cdots\text{H}$ contacts, Fig. 6*d*, the 19.0% contribution to

**Figure 6**

The full two-dimensional fingerprint plots for the title complex, showing (a) all interactions, and delineated into (b) $\text{H}\cdots\text{H}$, (c) $\text{H}\cdots\text{C/C}\cdots\text{H}$, (d) $\text{H}\cdots\text{O/O}\cdots\text{H}$, (e) $\text{H}\cdots\text{N/N}\cdots\text{H}$, (f) $\text{C}\cdots\text{C}$ and (g) $\text{O}\cdots\text{C/C}\cdots\text{O}$ interactions. The d_i and d_e values are the closest internal and external distances (in Å) from given points on the Hirshfeld surface contacts.

**Figure 7**

The Hirshfeld surface representations with the function d_{norm} plotted onto the surface for (a) H···H, (b) H···C/C···H, (c) H···O/O···H and (d) H···N/N···H interactions.

the HS arises from intermolecular O—H···O hydrogen bonding and is viewed as a pair of spikes with the tip at $d_e + d_i \sim 1.74$ Å. The short H···O/O···H contacts are masked by strong O—H···O hydrogen bonding in this plot. The H···N/N···H contacts in the structure, with a 1.9% contribution to the HS, has a symmetrical distribution of points, Fig. 6e, with the tips at $d_e + d_i \sim 2.96$ Å arising from the short interatomic H···N/N···H contact listed in Table 2. The Hirshfeld surface representations with the function d_{norm} plotted onto the surface are shown for the H···H, H···C/C···H, H···O/O···H and H···N/N···H interactions in Fig. 7a–d, respectively.

The Hirshfeld surface analysis confirms the importance of H-atom contacts in establishing the packing. The large number of H···H, H···C/C···H and H···O/O···H interactions suggest that van der Waals interactions and hydrogen bonding play the major roles in the crystal packing (Hathwar *et al.*, 2015).

5. Synthesis and crystallization

The title compound was prepared by the reaction of 3CdSO₄·8H₂O (0.64 g, 2.5 mmol) in water (50 ml) and nicotinamide (0.61 g, 5 mmol) in water (25 ml) with sodium 2,4,6-trimethylbenzoate (0.93 g, 5 mmol) in water (150 ml) at room temperature. The mixture was filtered and set aside to crystallize at ambient temperature for six weeks, giving colourless single crystals (yield: 1.42 g, 85%). Combustion analysis: found; C, 57.07, H, 5.67, N, 7.92%. Calculated: C₃₂H₃₆CdN₄O₇, C, 57.42; H, 5.43, N, 8.34%. FT-IR: 3390, 3122, 2921, 1669, 1619, 1539, 1445, 1399, 1113, 1038, 847, 731, 641 cm⁻¹.

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. The H atoms of the NH₂ group and of the water molecule were located in difference-Fourier maps and refined freely. The C-bound H atoms were positioned geometrically with C—H = 0.93 and 0.96 Å for aromatic and methyl H atoms, respectively, and constrained to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = k \times U_{\text{eq}}(\text{C})$, where $k = 1.5$ for methyl H-atoms and $k = 1.2$ for aromatic H-atoms.

Crystal structure and Hirshfeld surface analysis of aquabis(nicotinamide- κN^1)bis(2,4,6-trimethylbenzoato- $\kappa^2 O,O'$)cadmium(II)

Tuncer Hökelek, Safiye Özkaya and Hacali Necefoğlu

Computing details

Data collection: *APEX2* (Bruker, 2012); cell refinement: *SAINT* (Bruker, 2012); data reduction: *SAINT* (Bruker, 2012); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: *ORTEP-3 for Windows* (Farrugia, 2012); software used to prepare material for publication: *WinGX* (Farrugia, 2012) and *PLATON* (Spek, 2009).

Aquabis(nicotinamide- κN^1)bis(2,4,6-trimethylbenzoato- $\kappa^2 O,O'$)cadmium(II)

Crystal data

[Cd(C₁₀H₁₁O₂)₂(C₆H₅N₂O)₂(H₂O)]

$M_r = 701.05$

Orthorhombic, *Pbcn*

Hall symbol: -P 2n 2ab

$a = 23.6876$ (5) Å

$b = 15.6711$ (4) Å

$c = 9.0682$ (2) Å

$V = 3366.21$ (13) Å³

$Z = 4$

$F(000) = 1440$

$D_x = 1.383$ Mg m⁻³

Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å

Cell parameters from 9766 reflections

$\theta = 2.6\text{--}28.4^\circ$

$\mu = 0.70$ mm⁻¹

$T = 296$ K

Block, colorless

0.45 × 0.28 × 0.21 mm

Data collection

Bruker SMART BREEZE CCD

diffractometer

Radiation source: fine-focus sealed tube

Graphite monochromator

φ and ω scans

Absorption correction: multi-scan
(*SADABS*; Bruker, 2012)

$T_{\min} = 0.784$, $T_{\max} = 0.867$

68263 measured reflections

4213 independent reflections

3681 reflections with $I > 2\sigma(I)$

$R_{\text{int}} = 0.028$

$\theta_{\max} = 28.4^\circ$, $\theta_{\min} = 1.6^\circ$

$h = -31 \rightarrow 31$

$k = -20 \rightarrow 20$

$l = -11 \rightarrow 12$

Refinement

Refinement on F^2

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.047$

$wR(F^2) = 0.099$

$S = 1.32$

4213 reflections

215 parameters

0 restraints

Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites

H atoms treated by a mixture of independent and constrained refinement

$$w = 1/[\sigma^2(F_o^2) + (0.0171P)^2 + 5.5549P]$$

where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} = 0.001$

$$\Delta\rho_{\max} = 0.32 \text{ e } \text{\AA}^{-3}$$

$$\Delta\rho_{\min} = -0.47 \text{ e } \text{\AA}^{-3}$$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F , and R-factors based on ALL data will be even larger.
