The title compounds $C_{24}H_{21}NO_3S$, **I**, and $C_{24}H_{21}NO_4$, **II**, are the products of the IMDAV reaction between phenylmaleic anhydride and thietyl(furyl)allylamines. Their molecular structures comprise fused tricyclic systems containing thiophene, cyclohexene and pyrrolidine rings (**I**) or furan, cyclohexene and pyrrolidine rings (**II**). The central cyclohexene and pyrrolidine rings in both compounds adopt slightly twisted boat and envelope conformations, respectively. The dihedral angles between the basal plane of the pyrrolidine ring and the thiophene (in **I**) or furan (in **II**) ring plane are $22.74(16)$ and $26.29(5)$ °, respectively. The nitrogen atom both in **I** and **II** has practically planar environment [the sums of the bond angles are 359.8 and 358.9 °, respectively]. In the crystal of **I**, the molecules form hydrogen-bonded zigzag chains along [010] through strong intermolecular O—H···O hydrogen bonds involving carboxylic and keto groups, whereas in the crystal of **II**, the molecules are joined into centrosymmetric dimers by strong O—H···O hydrogen bonds between the carboxylic groups. In **II**, the atoms involved into these hydrogen bonds (and hence the whole carboxylic group) are disordered over two sets of sites with an occupancy ratio of 0.6:0.4. Compounds **I** and **II** crystallize as racemates consisting of enantiomeric pairs of the *3aSR,4RS,4aRS,7aSR* and *3aSR,4SR,4aRS,7aSR* diastereomers, respectively.

1. Chemical context

Cascade transformations including one or more tandem or sequential [4 + 2] cycloaddition reactions are a useful and high-usage tool in organic synthesis (Parvatkar *et al.*, 2014; Sears & Boger, 2016; Borisova *et al.*, 2018). In most cases, conjugated linear or cyclic alkadienes are the starting materials for these transformations. Along with this, it has long been known that furan, thiophene and pyrrole, possessing a conjugated system of double bonds, can also act as a diene moiety. Around 50 years ago, it was found that 2-vinylfurans and 2-vinylthiophenes can play the role of dienes in the intermolecular Diels–Alder reaction, which cleared a short way to benzofuran or benzothiophene derivatives (Paul, 1943; Szmuszkowicz & Modest, 1950; Schmidt, 1953; Scully & Brown, 1953; Davies & Porter, 1957*a,b*; Kaufmann & Sen Gupta, 1963; Anerewicz & Vogel, 1993; Drew *et al.*, 2002; Wavrin *et al.*, 2004; Ghobsi *et al.*, 2008). At the end of the last

OPEN ACCESS

**Figure 1**

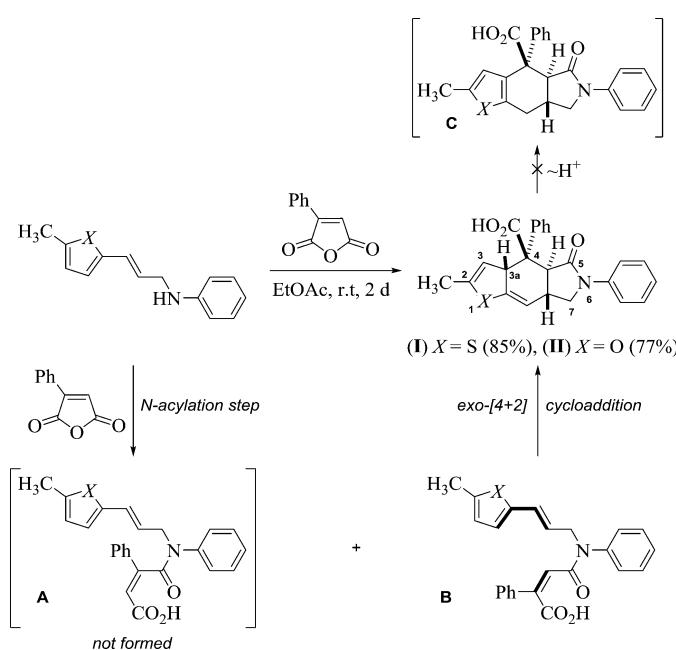

Intra- and intermolecular Diels–Alder reaction in vinylfurans and vinylthiophenes in the synthesis of benzofurans and benzothiophenes.

century, it was demonstrated that this reaction could be performed in an intramolecular variant when both a heterocyclic diene and a dienophilic moiety are incorporated in the same molecule.

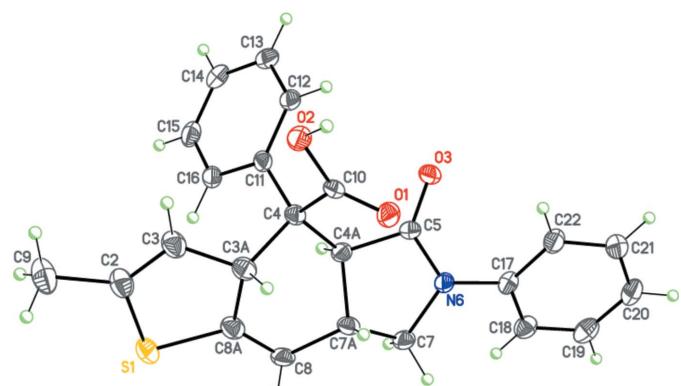

The IMDAV (IntraMolecular Diels–Alder Vinylarenes) reaction (Fig. 1) has become a powerful tool in organic synthesis because of its simplicity and reliability, which assures good yields of benzofurans and benzothiophenes annulated with other carbo- and heterocycles (Maas *et al.*, 2006; Patre *et al.*, 2007; Kim *et al.*, 2014).

Previously, with the example of the interaction between maleic anhydride and 3-thienyl(furyl)allylamines, our group demonstrated the possibility of the domino-sequence involving *N*-acylation, IMDAV reaction and aromatization steps leading to 4*H*-furo- or thieno[2,3-*f*]isoindoles (Horak *et al.*, 2015, 2017; Zubkov *et al.*, 2016). The aim of the present study was elucidation of the regio- and stereoselectivity of the reaction between phenylmaleic anhydride and thienyl(furyl)allylamines in order to establish the scope and the limitations of the IMDAV reaction (Fig. 2).

The reaction proceeds smoothly at room temperature, a simple filtration of the resulting crystalline products from ethyl acetate giving adducts **I** and **II** in good yields. The Diels–

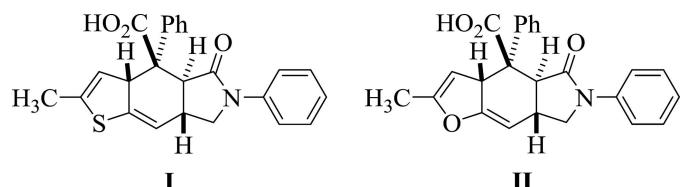

**Figure 2**

Synthesis of (3a*SR*,4*RS*,4a*RS*,7a*SR*)-5-oxothieno[2,3-*f*]isoindole-4-carboxylic acid (**I**) and (3a*SR*,4*SR*,4a*RS*,7a*SR*)-5-oxofuro[2,3-*f*]isoindole-4-carboxylic acid (**II**).

**Figure 3**

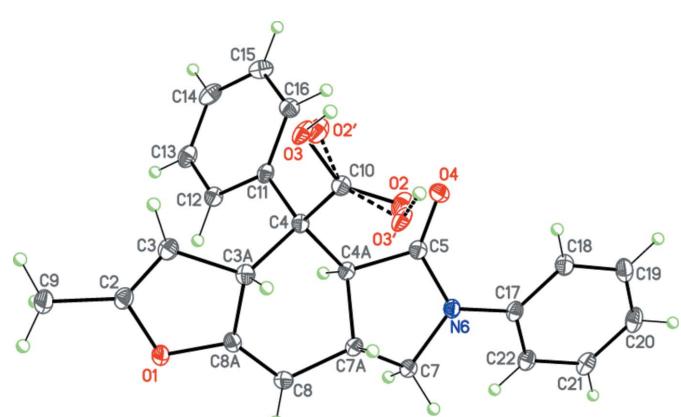

Molecular structure of **I**. Displacement ellipsoids are shown at the 50% probability level. H atoms are presented as small spheres of arbitrary radius.

Alder reaction proceeds regio- and stereoselectively as an *exo*-[4 + 2] cycloaddition (Fig. 2). The nucleophilic attack of the nitrogen atom is directed at the least sterically hindered carbon atom of the carbonyl group of phenylmaleic anhydride, thus amide **A** is not formed. The intermediate amide **B** cannot be isolated, and the spontaneous intramolecular Diels–Alder reaction completes the process, leading to the target compounds **I** and **II**. The migration of proton H3a in adducts **I**, **II** and the formation of compound **C** is not observed under these conditions (Horak *et al.*, 2015, 2017; Zubkov *et al.*, 2016).

2. Structural commentary

Despite the very similar molecular structures, compounds **I**, C₂₄H₂₁NO₃S and **II**, C₂₄H₂₁NO₄ are not isostructural.

**Figure 4**

Molecular structure of **II**. Displacement ellipsoids are shown at the 50% probability level. H atoms are presented as small spheres of arbitrary radius. The minor occupancy position of the –COOH group is depicted with dashed lines.

Compound **I** crystallizes in the monoclinic space group $P2_1/n$, while compound **II** crystallizes in the triclinic space group $\bar{P}1$.

The molecules of **I** and **II** comprise fused tricyclic systems containing thiophene, cyclohexene and pyrrolidine rings in **I** (Fig. 3) and furan, cyclohexene and pyrrolidine rings in **II** (Fig. 4). The central cyclohexene and pyrrolidine rings in both compounds adopt slightly distorted boat and envelope conformations, respectively. The dihedral angles between the basal plane of the pyrrolidine ring ($N5/N6/C4A/C7$) and the thiophene (in **I**) or furan (in **II**) ring planes are $22.74(16)$ and $26.29(5)$ °, respectively. The $N6$ nitrogen atom both in **I** and **II** has practically planar environment (the sums of the bond angles are 359.8 and 358.9 °, respectively).

In the molecule of **II**, the carboxylic group is disordered over two orientations with interchanging hydrogen atom positions (Fig. 4), the occupancy ratio being $0.6:0.4$.

The molecules of **I** and **II** possess four asymmetric centers at the $C3A$, $C4$, $C4A$ and $C7A$ carbon atoms and potentially can have numerous diastereomers. The crystals of **I** and **II** are racemic and consist of enantiomeric pairs with the following relative configuration of the centers: $3aSR,4RS,4aRS,7aSR$ and $3aSR,4SR,4aRS,7aSR$, respectively, thus **I** and **II** differ in the configuration at the $C4$ atom.

3. Supramolecular features

In the crystal of **I**, molecules form hydrogen-bonded zigzag chains propagating along [010] through strong $O-H\cdots O$ hydrogen bonds involving the carboxylic and keto groups (Table 1, Fig. 5).

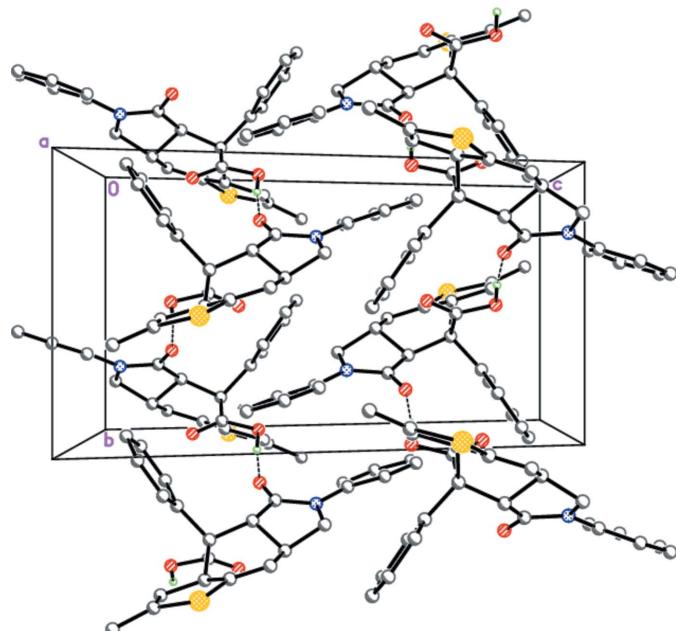

Figure 5

The hydrogen-bonded zigzag chains along the b -axis direction in **I**. Dashed lines indicate the intermolecular $O-H\cdots O$ hydrogen bonds.

Table 1
Hydrogen-bond geometry (\AA , °) for **I**.

$D-H\cdots A$	$D-H$	$H\cdots A$	$D\cdots A$	$D-H\cdots A$
$O2-H2\cdots O3^i$	1.04 (5)	1.63 (5)	2.667 (4)	174 (4)

Symmetry code: (i) $-x + \frac{1}{2}, y + \frac{1}{2}, -z + \frac{1}{2}$.

Table 2
Hydrogen-bond geometry (\AA , °) for **II**.

$D-H\cdots A$	$D-H$	$H\cdots A$	$D\cdots A$	$D-H\cdots A$
$O3-H3B\cdots O2^i$	0.91 (3)	1.79 (3)	2.692 (3)	176 (3)
$O3'-H3C\cdots O2^{i'}$	0.91 (5)	1.79 (5)	2.690 (6)	169 (4)

Symmetry code: (i) $-x + 1, -y + 1, -z + 2$.

Contrary to **I**, in the crystal of **II**, molecules form hydrogen-bonded centrosymmetric dimers through pairs of strong $O-H\cdots O$ hydrogen bonds between two carboxylic groups (Table 2, Fig. 6). The dimers are stacked along the a -axis direction.

4. Synthesis and crystallization

2-Methyl-4,6-diphenyl-4,4a,5,6,7,7a-hexahydro-3aH-thieno-(furo)[2,3-f]isoindole-4-carboxylic acids (**I** and **II**) were synthesized using a method similar to the procedure described recently (Horak *et al.*, 2015, 2017; Zubkov *et al.*, 2016).

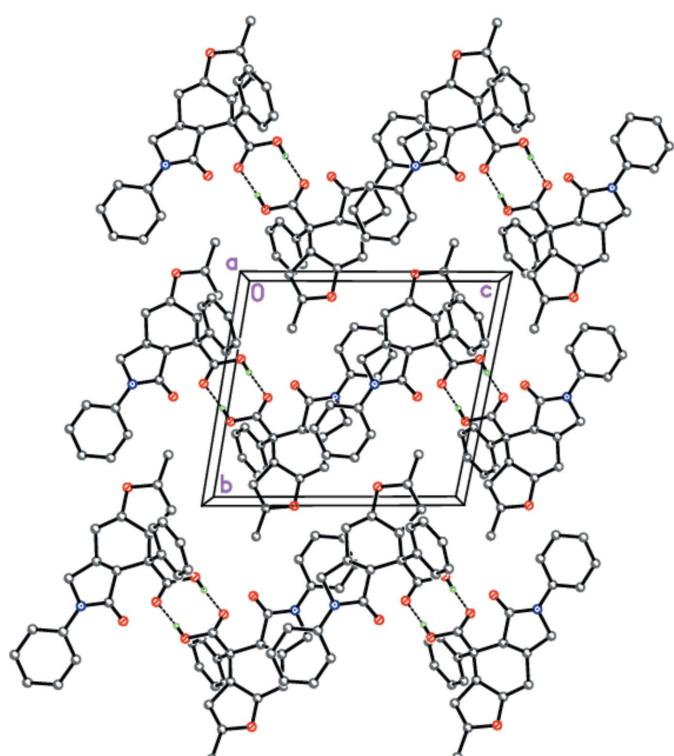

Figure 6

The hydrogen-bonded centrosymmetric dimers of **II**. Dashed lines indicate the intermolecular $O-H\cdots O$ hydrogen bonds. The minor occupancy $-COOH$ groups are omitted for clarity.

Computer programs: *MarCCD* (Doyle, 2011), *iMosflm* (Battye *et al.*, 2011), *SHELXT* (Sheldrick, 2015a), *SHELXL2014* (Sheldrick, 2015b) and *SHELXTL* (Sheldrick, 2008).

General procedure. A solution of *N*-(2*E*)-3-(5-methyl-thiophen-2-yl)prop-2-en-1-yl]aniline (for **I**) or *N*-(2*E*)-3-(5-methylfuran-2-yl)prop-2-en-1-yl]aniline (for **II**) (2 mmol) in ethyl acetate (10 mL) was placed into a 25 mL round-bottom flask and then phenylmaleic anhydride (0.35 g, 2.0 mmol) was added. The mixture was stirred for two days at room temperature. The formed precipitate was filtered off, washed with Et₂O (2 × 10 mL) and dried in air. The resulting product was recrystallized from a mixture of EtOH–DMF (5:1 *v:v*) to afford the analytically pure samples of target products.

(3aRS,4SR,4aSR,7aSR)-2-Methyl-5-oxo-4,6-diphenyl-4,4a,5,6,7,7a-hexahydro-3aH-thieno[2,3-f]isoindole-4-carboxylic acid (I). Colourless prisms. Yield 0.69 g (85%). M.p. = 447.1–448.1 K. MS (APCI): *m/z* = 388 [M + H]⁺.

5. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. X-ray diffraction studies were carried out on the ‘Belok’ beamline of the National Research Center ‘Kurchatov Institute’ (Moscow, Russian Federation) using a Rayonix SX165 CCD detector. A total of 720 images for each compounds were collected using an oscillation range of 1.0° (φ scan mode, two different crystal orientations) and corrected for absorption using the SCALA program (Evans, 2006). The data were indexed, integrated and scaled using the utility *iMOSFLM* in the CCP4 program (Battye *et al.*, 2011).

The COOH-group in **II** is disordered over two orientations. The refinement of their occupancy factors was unstable, thus the occupancies were constrained to a 0.6:0.4 ratio. The two positions of this group were refined at fixed C=O and C–O distances of 1.210 (3) and 1.320 (3) Å, respectively. Moreover,

the anisotropic displacement parameters for the oxygen atoms of the C=O and C—O groups were restrained to be equal.

The hydrogen atoms of the OH groups were localized in difference-Fourier maps and refined isotropically with fixed displacement parameters [$U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$]. The other hydrogen atoms were placed in calculated positions with C—H = 0.95–1.00 Å and refined using the riding model with fixed isotropic displacement parameters [$U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for the CH_3 groups and $1.2U_{\text{eq}}(\text{C})$ for all others].

A relatively large number of reflections (a few dozen) were omitted for the following reasons: (1) In order to achieve better I/σ statistics for high-angle reflections we selected a larger exposure time, which resulted in some intensity overloads in the low-angle part of the area. These corrupted intensities were excluded from the final steps of the refinement. (2) In the current setup of the instrument, the low-temperature device eclipses a small region of the detector near its high-angle limit. This resulted in zero intensity for some reflections. (3) The quality of the single crystals chosen for the diffraction experiments was far from perfect. Some systematic intensity deviations can be due to extinction and defects present in the crystals.

Absorption correction: multi-scan
(SCALA; Evans, 2006)
 $T_{\min} = 0.930$, $T_{\max} = 0.950$
12006 measured reflections

4140 independent reflections
2888 reflections with $I > 2\sigma(I)$
 $R_{\text{int}} = 0.101$
 $\theta_{\max} = 38.4^\circ$, $\theta_{\min} = 3.6^\circ$
 $h = -12 \rightarrow 18$
 $k = -10 \rightarrow 8$
 $l = -21 \rightarrow 14$

Refinement

Refinement on F^2
Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.082$
 $wR(F^2) = 0.244$
 $S = 1.04$
4140 reflections
267 parameters

0 restraints
Primary atom site location: difference Fourier map
Secondary atom site location: difference Fourier map
Hydrogen site location: mixed

H atoms treated by a mixture of independent
and constrained refinement
 $w = 1/[\sigma^2(F_o^2) + (0.08P)^2 + 4P]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\text{max}} < 0.001$

$\Delta\rho_{\text{max}} = 0.57 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\text{min}} = -0.83 \text{ e } \text{\AA}^{-3}$
 Extinction correction: SHELXL (Sheldrick,
 2015b), $Fc^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
 Extinction coefficient: 0.027 (4)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Data collection

Rayonix SX165 CCD	T _{min} = 0.963, T _{max} = 0.987
diffractometer	18107 measured reflections
/f scan	4204 independent reflections
Absorption correction: multi-scan (SCALA; Evans, 2006)	3839 reflections with $I > 2\sigma(I)$
	R _{int} = 0.092

$\theta_{\max} = 31.0^\circ$, $\theta_{\min} = 3.4^\circ$
 $h = -10 \rightarrow 10$

$k = -13 \rightarrow 13$
 $l = -14 \rightarrow 14$

Refinement

Refinement on F^2
Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.048$
 $wR(F^2) = 0.129$
 $S = 1.06$
4204 reflections
276 parameters
4 restraints
Primary atom site location: difference Fourier map
Secondary atom site location: difference Fourier map

Hydrogen site location: mixed
H atoms treated by a mixture of independent and constrained refinement
 $w = 1/[\sigma^2(F_o^2) + (0.0543P)^2 + 0.2912P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 0.31 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.25 \text{ e } \text{\AA}^{-3}$
Extinction correction: SHELXL2014 (Sheldrick, 2015b),
 $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Extinction coefficient: 0.060 (10)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters (\AA^2)
