The crystal structures of (*E*)-*N'*-(2-chlorobenzylidene)-4-nitrobenzenesulfonohydrazide, $C_{13}H_{10}ClN_3O_4S$ (I), (*E*)-*N'*-(2-methylbenzylidene)-4-nitrobenzenesulfonohydrazide, $C_{14}H_{13}N_3O_4S$ (II), and (*E*)-*N'*-(4-methylbenzylidene)-4-nitrobenzenesulfonohydrazide monohydrate, $C_{14}H_{13}N_3O_4S \cdot H_2O$ (III), have been synthesized, characterized and their crystal structures determined to study the effects of the nature and sites of substitutions on the structural parameters and the hydrogen-bonding interactions. All three compounds crystallize in the monoclinic crystal system, with space group $P2_1$ for (I) and $P2_1/c$ for (II) and (III). Compound (III) crystallizes as a monohydrate. All three compounds adopt an *E* configuration around the $C\equiv N$ bond. The molecules are bent at the S atom with C—S—N—N torsion angles of $-59.0(3)$, $58.0(2)$ and $-70.2(1)^\circ$ in (I), (II) and (III), respectively. The sulfonohydrazide parts are also non-linear, as is evident from the S—N—N—C torsional angles of $159.3(3)$, $-164.2(1)$ and $152.3(1)^\circ$ in (I), (II) and (III), respectively, while the hydrazide parts are almost planar with the N—N=C—C torsion angles being $-179.1(3)^\circ$ in (I), $176.7(2)^\circ$ in (II) and $175.0(2)^\circ$ in (III). The 4-nitro-substituted phenylsulfonyl and 2/4-substituted benzylidene rings are inclined to each other by $81.1(1)^\circ$ in (I), $81.4(1)^\circ$ in (II) and $74.4(1)^\circ$ in (III). The compounds show differences in hydrogen-bonding interactions. In the crystal of (I), molecules are linked via N—H···O hydrogen bonds, forming $C(4)$ chains along the a -axis direction that are interconnected by weak C—H···O hydrogen bonds, generating layers parallel to the ac plane. In the crystal of (II), the amino H atom shows bifurcated N—H···O(O) hydrogen bonding with both O atoms of the nitro group generating $C(9)$ chains along the b -axis direction. The chains are linked by weak C—H···O hydrogen bonds, forming a three-dimensional framework. In the crystal of (III), molecules are linked by Ow—H···O, N—H···Ow and C—H···O hydrogen bonds, forming layers lying parallel to the bc plane. The fingerprint plots generated for the three compounds show that for (I) and (II) the O···H/H···O contacts make the largest contributions, while for the *para*-substituted compound (III), H···H contacts are the major contributors to the Hirshfeld surfaces.

1. Chemical context

Sulfonyl hydrazides have been used extensively to synthesize new Schiff bases owing to the presence of two chemically and biologically important sulfonyl and hydrazine moieties (Murtaza *et al.*, 2016). Reactions of hydrazines with other functional groups produce compounds with unique physical and chemical characteristics (Xavier *et al.*, 2012). Hydrazones derived from the condensation reactions of hydrazides with aldehydes show excellent biological properties (Küçüküzel *et*

al., 2006). As a result of the ease of the electron-transport mechanism through the π -conjugated framework, the azomethine-bridged benzene derivatives exhibit excellent optical non-linearities (Manivannan & Dhanuskodi, 2004). Organic polymers containing the azomethine group are known to have good mechanical strength (Morgan *et al.*, 1987) and high thermal stability (Catanescu *et al.*, 2001). As part of our continuing studies to explore the effect of the nature and site of substituents on the crystal structures of sulfonyl hydrazide derivatives (Salian *et al.*, 2018), we report herein the synthesis, crystal structures and Hirshfeld surface analyses of the title compounds, (*E*)-4-nitro-*N'*-(2-chlorobenzylidene)-benzenesulfonohydrazide (I), (*E*)-4-nitro-*N'*-(2-methylbenzylidene)benzenesulfonohydrazide (II) and (*E*)-4-nitro-*N'*-(4-methylbenzylidene)benzenesulfonohydrazide monohydrate (III).

2. Structural commentary

The title compounds crystallize in the monoclinic crystal system, in space group $P2_1$ for (I) and $P2_1/c$ for (II) and (III). The molecular structures of the three compounds are shown in Figs. 1, 2 and 3. Compound (III) crystallizes as a monohydrate. In all three compounds the configuration about the $C\equiv N$ bond is *E*, with $C7=N2$ bond lengths of 1.269 (5), 1.275 (2) and 1.263 (3) Å in (I), (II) and (III), respectively. The respective $N1-N2$ bond lengths of 1.404 (4), 1.400 (2) and 1.398 (2) Å are consistent with the azine bond lengths of

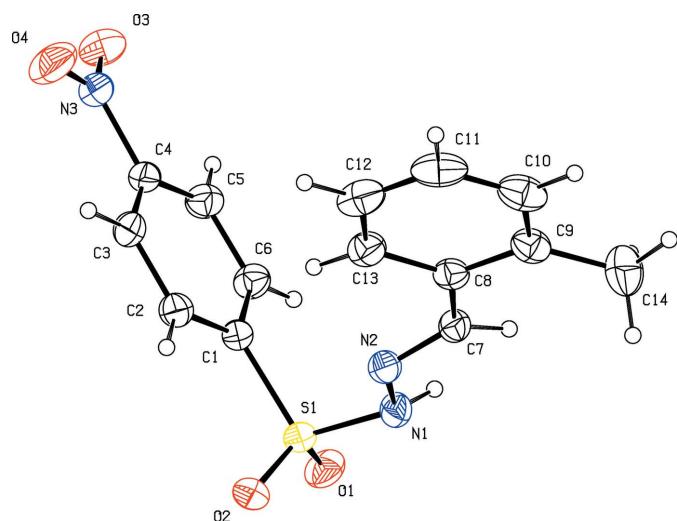

Figure 2
Molecular structure of compound (II), showing the atom labelling and displacement ellipsoids drawn at the 30% probability level.

1.40 Å in similar structures (Salian *et al.*, 2018), indicating the delocalization of π -electron density over the hydrazone portion of the molecules. The conformation of the $N-H$ and $C-H$ bonds in (I) and (II), with respect to the *ortho*-substituents, are *syn* to each other (Figs. 1 and 2). In the central parts of each molecule the $S1-N1-N2=C7$ torsion angles deviate from linearity with values of 159.3 (3) $^\circ$ in (I), -164.2 (1) $^\circ$ in (II) and 152.3 (1) $^\circ$ in (III), while the hydrazone parts are almost planar with the $N1-N2=C7-C8$ torsion angles being -179.1 (3), 176.7 (2) and 175.0 (2) $^\circ$ in (I), (II) and (III), respectively. The dihedral angles between the 4-nitrobenzene ring ($C1-C6$) and benzene ring ($C8-C13$) are 81.1 (1), 81.4 (1) and 74.4 (1) $^\circ$, respectively. The plane of the nitro group ($N3/O3/O4$) is inclined to the 4-nitrobenzene ring ($C1-C6$) by 9.3 (5) $^\circ$ in (I) and 9.1 (3) $^\circ$ in (II), but is significantly out of plane in (III) with a dihedral angle of 16.1 (2) $^\circ$.

3. Supramolecular features

In the crystals of the title compounds there are significant difference in the hydrogen-bonding interactions. In the crystal of the *ortho*-chloro-substituted compound (I), molecules are linked via $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds, forming C_4 chains along the a -axis direction (Table 1 and Fig. 4). These chains are interconnected by weak $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds, generating layers parallel to the ab plane (Table 1 and Fig. 5). In the crystal of the *ortho*-methyl-substituted compound (II), the amino H atom shows bifurcated $\text{N}-\text{H}\cdots\text{O}(\text{O})$ hydrogen

bonding with both the O atoms of the nitro group, generating chains with a $C(9)$ motif that propagate along the b -axis direction (Table 2 and Fig. 6). These chains are linked by $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds, resulting in the formation of a three-dimensional framework (Table 2 and Fig. 7). Finally, in the crystal of the *para*-methyl-substituted compound (III), the

4. Hirshfeld surface analysis

The type of intermolecular contacts and their quantitative contribution to the crystal packing in all the three compounds were studied by Hirshfeld surfaces and two-dimensional fingerprint plots, which were generated using *Crystal-Explorer3.1* (Wolff *et al.*, 2012). The Hirshfeld surfaces mapped over d_{norm} are in the scale of -0.56 – 1.43 a.u. The bright-red spots on the Hirshfeld surfaces mapped over d_{norm} indicate the strong N—H \cdots O interactions present in the crystal structure (McKinnon *et al.*, 2004; Spackman & Jayatilaka, 2009); these correspond to N1—H1N \cdots O1ⁱ in (I) (Fig. 9a; Table 1), N1—H1N \cdots O3ⁱ and N1—H1N \cdots O4ⁱ in (II) (Fig. 9b; Table 2) and N1—H1N \cdots O5ⁱ, O5—H51 \cdots O2ⁱⁱ and O5—H52 \cdots O1ⁱⁱⁱ in (III) (Fig. 9c; Table 3). The fingerprint plots corresponding to the various contacts contributing more than 10% (along with the C \cdots C contacts) to the Hirshfeld surfaces are shown in Fig. 10. Table 4 lists all the contacts present in the crystal structures of the three compounds, and their respective percentage contributions to the Hirshfeld surfaces. The O \cdots H/H \cdots O contacts correspond to the N—H \cdots O/O—H \cdots O interactions at $d_e + d_i \sim 2.2$ \AA in (I) and (III) and at 2.6 \AA in (II), which is very close to the hydrogen-bonding

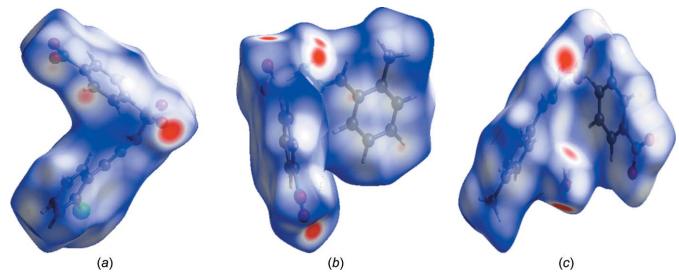

Figure 9

View of the Hirshfeld surface mapped over d_{norm} for (a) (I), (b) (II) and (c) (III).

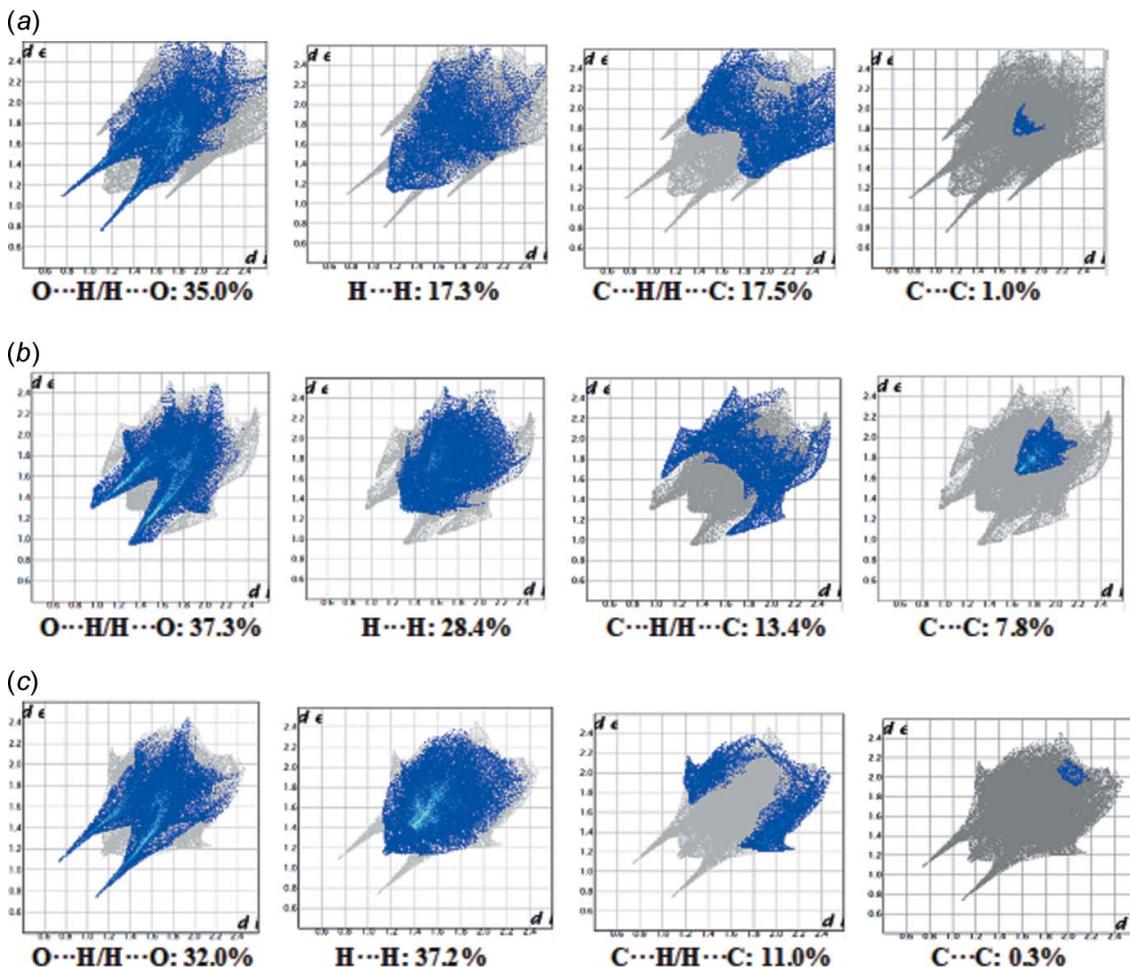

Figure 10
Two-dimensional fingerprint plots showing the contributions of the different types of interactions in (a) (I), (b) (II) and (c) (III).

distances observed in these compounds [Tables 1, 2 and 3 for (I), (II) and (III), respectively]. These interactions are the major contributor in (I) and (II) [35.0% in (I) and 37.3% in (II)] followed by $\text{H}\cdots\text{H}$ contacts [17.5% in (I) and 28.4% in (II)]. In (III), $\text{H}\cdots\text{H}$ interactions make the largest contribution to the Hirshfeld surface (37.2%), followed by $\text{O}\cdots\text{H}/\text{H}\cdots\text{O}$ contacts (32.0%). The $\text{H}\cdots\text{H}$ interactions appear as a short single peak at $d_e + d_i \sim 2.2 \text{ \AA}$ in the fingerprint plot of (III) (see Fig. 10c). The distinct pair of wings corresponds to $\text{C}\cdots\text{H}/\text{H}\cdots\text{C}$ contacts, which are the third largest contributor to the Hirshfeld surfaces in all three compounds [17.3% in (I), 13.4% in (II) and 11.0% in (III)]. A significant difference is in the percentage contribution from $\text{C}\cdots\text{C}$ contacts found for the three compounds. They are characterized by two overlapping broad peaks in the fingerprint plot for (II) (see Fig. 10b), accounting for 7.8% of the Hirshfeld surface with $d_e + d_i \sim 3.4 \text{ \AA}$, whereas for (I) and (III) these interactions make negligible contributions of 1.0 and 0.3%, respectively. The $\text{O}\cdots\text{C}/\text{C}\cdots\text{O}$ contacts contribute 4.3% in (I), 1.8% in (II) and 9.4% in (III). $\text{N}\cdots\text{H}/\text{H}\cdots\text{N}$ contacts contribute 4.3, 7.3 and 5.0% in (I), (II) and (III), respectively. In (I), the $\text{Cl}\cdots\text{H}/\text{H}\cdots\text{Cl}$, $\text{Cl}\cdots\text{C/C}\cdots\text{Cl}$, $\text{Cl}\cdots\text{O/O}\cdots\text{Cl}$ and $\text{Cl}\cdots\text{N/N}\cdots\text{Cl}$ contacts contribute 6.1, 4.7, 3.1 and 1.4%, respectively, to the

Hirshfeld surfaces. The percentage contributions for the various interactions in the title compounds are compared in Table 4.

5. Database survey

Structures similar to the title compounds that have been reported in the literature include *N'*-(*E*-4-methylbenzylidene)-4-methylbenzenesulfonohydrazide (Tabatabaei *et al.*, 2007), (*E*-*N'*-(4-chlorobenzylidene)-*p*-toluenesulfonohydrazide 0.15-hydrate (Kia *et al.*, 2009a), (*E*-*N'*-(4-chlorobenzylidene)-4-methylbenzenesulfonohydrazide (Balaji *et al.*, 2014), (*E*-*N'*-(4-bromobenzylidene)-*p*-toluenesulfonohydrazide (Kia *et al.*, 2009b), (*E*-*N'*-(4-nitrobenzylidene)-benzenesulfonohydrazide (Hussain *et al.*, 2017a), *E*-4-methyl-*N'*-(4-nitrobenzylidene)benzenesulfonohydrazide (Hussain *et al.*, 2017b), (*E*-*N'*-(2-methylbenzylidene)-4-chlorobenzene-sulfonohydrazide and (*E*-*N'*-(4-methylbenzylidene)-4-chlorobenzenesulfonohydrazide (Saliani *et al.*, 2018). In all the structures, intermolecular $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds link neighbouring molecules to form chains, which are linked by $\pi-\pi$ interactions, further stabilizing the crystal structures. The chains are linked via $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds, forming

layers. This situation is similar to that in the recently reported structures of (*E*)-N'-benzylidene-4-chlorobenzenesulfonohydrazine and the 2-methylbenzylidene derivative, (*E*)-N'-(2-methylbenzylidene)-4-chlorobenzenesulfonohydrazine (Salian *et al.*, 2018).

6. Synthesis and crystallization

Synthesis of 4-nitrobenzenesulfonohydrazide

Hydrazine hydrate (99%, 5 ml) was added to 4-nitrobenzenesulfonyl chloride (0.01 mol), dissolved in ethanol (30 ml) at 273 K under constant stirring. The stirring continued for 15 min at 273 K and then at 303 K for 3 h. The reaction mixture was then concentrated by evaporating off the excess ethanol. The solid product obtained, *i.e.* 4-nitrobenzenesulfonohydrazide, was washed with cold water and dried.

Synthesis of the title compounds (I), (II) and (III)

The title compounds were synthesized by refluxing the mixtures of 4-nitrobenzenesulfonohydrazide (0.01 mol) and 0.01 mol of 2-chlorobenzaldehyde for (I), 2-methylbenzaldehyde for (II), and 4-methylbenzaldehyde for (III), in

ethanol (30 ml) and two drops of glacial acetic acid for 4 h. The reaction mixtures were cooled to room temperature and concentrated by evaporating off the excess of solvent. The solid products obtained were washed with cold water, dried and recrystallized to constant melting points from ethanol. Purity of the compounds was checked by TLC. All three compounds were characterized by measuring their IR, ¹H and ¹³C NMR spectra.

(*E*)-N'-(2-chlorobenzylidene)-4-nitrobenzenesulfonohydrazide (I)

Colourless prismatic crystals; m.p: 438–439 K; IR (cm⁻¹): 3182.5 (N—H asym. stretch), 1604.8 (C≡N), 1311.6 (S=O asym. stretch) and 1168.9 (S=O sym. stretch).

Yellow rod-shaped crystals; m.p: 417–418 K; IR (cm^{-1}): 3217.3 (N—H *asym. stretch*), 1602.9 (C≡N), 1332.1 (S=O *asym. stretch*) and 1172.7 (S=O *sym. stretch*).

^1H NMR (400 MHz, DMSO- d_6): δ 2.31 (*s*, 3H), 7.34–7.37 (*m*, 3H, Ar-H), 7.40 (*t*, 1H, Ar-H), 7.81 (*d*, 1H, Ar-H), 8.16 (*d*, 1H, Ar-H), 8.31 (*s*, 1H), 8.44 (*d*, 2H, Ar-H), 12.10 (*s*, 1H). ^{13}C NMR (400 MHz, DMSO- d_6): δ 20.97, 124.21, 125.90, 126.78, 128.75, 129.01, 130.61, 131.68, 139.99, 144.48, 148.13, 149.74.

(E)-N'-(4-methylbenzylidene)-4-nitrobenzenesulfono-hydrazone (III)

Yellow prismatic crystals; m.p: 447–448 K; IR (cm^{-1}): 3291.5 (N—H *asym. stretch*), 1606.7 (C≡N), 1305.8 (S=O *asym. stretch*) and 1165.0 (S=O *sym. stretch*).

^1H NMR (400 MHz, DMSO- d_6): δ 2.31 (*s*, 3H), 7.34 (*d*, 2H, Ar-H), 7.60 (*d*, 2H, Ar-H), 8.16 (*d*, 2H, Ar-H), 8.30 (*s*, 1H), 8.42 (*d*, 2H, Ar-H), 12.03 (*s*, 1H); ^{13}C NMR (400 MHz, DMSO- d_6): δ 20.96, 123.81, 126.65, 128.59, 128.96, 130.47, 139.94, 144.64, 147.96, 149.58.

Single crystals of the title compounds used for the single-crystal X-ray diffraction analyses were obtained by slow evaporation of the solvent in their DMF solutions at room temperature.

7. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 5. The C-bound H atoms were positioned with idealized geometry and refined using a riding model with the aromatic C—H = 0.93 Å. The amino H atoms were refined with an N—H distance restraint of 0.86 (2) Å. For (III), the H atoms of the water molecule were refined with the O—H distance restrained to 0.82 (2) Å. All H atoms were refined with isotropic displacement parameters set at 1.2 U_{eq} (C-aromatic, N, O) and 1.5 U_{eq} (C-methyl). For (I), the low angle reflection (0 $\bar{2}$ 1) had a poor agreement with its calculated value and was omitted from the refinement.

Acknowledgements

The authors thank SAIF Panjab University for extending the services of their NMR facility and Mangalore University for providing all the facilities required.

Funding information

ARS thanks the Department of Science and Technology, Government of India, New Delhi, for a research fellowship under its DST-PURSE Program and BTG thanks the University Grants Commission, Government of India, New Delhi, for a special grant under a UGC-BSR one-time grant to faculty.

Crystal structures and the Hirshfeld surface analysis of (*E*)-4-nitro-*N'*-(*o*-chloro, *o*- and *p*-methylbenzylidene)benzenesulfonohydrazides

Akshatha R. Salian, Sabine Foro and B. Thimme Gowda

Computing details

For all structures, data collection: *CrysAlis CCD* (Oxford Diffraction, 2009); cell refinement: *CrysAlis RED* (Oxford Diffraction, 2009); data reduction: *CrysAlis RED* (Oxford Diffraction, 2009); program(s) used to solve structure: *SHELXS2013* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL2014* (Sheldrick, 2015); molecular graphics: *PLATON* (Spek, 2009); software used to prepare material for publication: *SHELXL2014* (Sheldrick, 2015).

(*E*)-*N'*-(2-Chlorobenzylidene)-4-nitrobenzenesulfonohydrazide (I)

Crystal data

$C_{13}H_{10}ClN_3O_4S$
 $M_r = 339.75$
Monoclinic, $P2_1$
 $a = 4.9498 (6)$ Å
 $b = 22.340 (3)$ Å
 $c = 7.0003 (9)$ Å
 $\beta = 104.40 (1)$ °
 $V = 749.76 (17)$ Å³
 $Z = 2$

$F(000) = 348$
 $D_x = 1.505 \text{ Mg m}^{-3}$
Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Cell parameters from 1264 reflections
 $\theta = 3.0\text{--}27.7$ °
 $\mu = 0.42 \text{ mm}^{-1}$
 $T = 293$ K
Prism, colourless
 $0.24 \times 0.24 \times 0.12$ mm

Data collection

Oxford Diffraction Xcalibur single crystal X-ray diffractometer with Sapphire CCD detector
Radiation source: Enhance (Mo) X-ray Source
Rotation method data acquisition using ω scans.
Absorption correction: multi-scan
(CrysAlis RED; Oxford Diffraction, 2009)
 $T_{\min} = 0.907$, $T_{\max} = 0.952$
4582 measured reflections

2696 independent reflections
2457 reflections with $I > 2\sigma(I)$
 $R_{\text{int}} = 0.015$
 $\theta_{\max} = 25.4$ °, $\theta_{\min} = 3.0$ °
 $h = -3\text{--}5$
 $k = -26\text{--}26$
 $l = -8\text{--}7$

Refinement

Refinement on F^2
Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.030$
 $wR(F^2) = 0.078$
 $S = 1.01$
2696 reflections
202 parameters
2 restraints
Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map
Hydrogen site location: mixed
H atoms treated by a mixture of independent and constrained refinement
 $w = 1/[\sigma^2(F_o^2) + (0.0489P)^2 + 0.0544P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 0.14 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.20 \text{ e } \text{\AA}^{-3}$

Absolute structure: Flack x determined using
 1102 quotients $[(I^+)-(I)]/[(I^+)+(I)]$ (Parsons *et al.*, 2013)
 Absolute structure parameter: 0.05 (3)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Cell parameters from 2833 reflections
 $\theta = 2.6\text{--}27.8$ °
 $\mu = 0.24 \text{ mm}^{-1}$
 $T = 293$ K
Rod, yellow
 $0.50 \times 0.48 \times 0.24$ mm

Data collection

Oxford Diffraction Xcalibur single crystal X-ray diffractometer with Sapphire CCD detector
Radiation source: Enhance (Mo) X-ray Source
Rotation method data acquisition using ω scans.
Absorption correction: multi-scan
(CrysAlis RED; Oxford Diffraction, 2009)
 $T_{\min} = 0.889$, $T_{\max} = 0.945$
9810 measured reflections

2719 independent reflections
2271 reflections with $I > 2\sigma(I)$
 $R_{\text{int}} = 0.020$
 $\theta_{\max} = 25.4$ °, $\theta_{\min} = 2.7$ °
 $h = -8 \rightarrow 5$
 $k = -18 \rightarrow 18$
 $l = -11 \rightarrow 16$

Refinement

Refinement on F^2
Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.038$
 $wR(F^2) = 0.097$
 $S = 1.05$
2719 reflections
203 parameters
2 restraints
Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map
Hydrogen site location: mixed
H atoms treated by a mixture of independent and constrained refinement
 $w = 1/[\sigma^2(F_o^2) + (0.0372P)^2 + 0.8005P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} = 0.001$
 $\Delta\rho_{\max} = 0.28 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.32 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
