In this study, a new monoclinic polymorph (space group  $C2/c$ ) of 2,2'-methylenebis(isoindoline-1,3-dione),  $C_{12}H_{10}N_2O_4$ , is reported and compared to the previously reported triclinic polymorph (space group  $P\bar{1}$ ). Similarly, both polymorphs consist of a unique molecule in the asymmetric unit ( $Z' = 1$ ). The molecular conformations of the two polymorphs are very similar, as shown by the r.m.s. deviation of  $0.368 \text{ \AA}$  (excluding all H atoms). The intermolecular interactions of both polymorphs are described along with the Hirshfeld surface analysis, and the lattice energies are calculated.

### 1. Chemical context

Phthalimide (or isoindoline-1,3-dione) derivatives with five-membered *N*-heterocycles have been proven to exhibit significant biological and pharmaceutical activities, and have also been used as dyes and heat-resistant polymers in industry (Chidan Kumar *et al.*, 2015; Then *et al.*, 2018). The first reported crystal structure of 2,2'-methylenebis(isoindoline-1,3-dione) ( $1\alpha$ ; Jiang *et al.*, 2007) crystallizes in the centrosymmetric triclinic space group  $P\bar{1}$  [ $a = 7.6660(9) \text{ \AA}$ ,  $b = 9.5810(8) \text{ \AA}$ ,  $c = 10.2780(6) \text{ \AA}$ ,  $\alpha = 104.325(3)^\circ$ ,  $\beta = 99.768(4)^\circ$ ,  $\gamma = 96.030(3)^\circ$ ,  $Z = 2$ ,  $Z' = 1$  and  $V = 712.23(11) \text{ \AA}^3$ ; Cambridge Structural Database (CSD; Groom *et al.*, 2016) refcode SINDID]. In this article, we report the second polymorphic form ( $1\beta$ ) of 2,2'-methylenebis(isoindoline-1,3-dione) with  $Z' = 1$  and compare its properties with those of  $1\alpha$ . According to the Online Dictionary of Crystallography, polymorphism is the phenomenon in which the same chemical compound exhibits different crystal structures (IUCr, 2018).

## 2. Structural commentary

The asymmetric units of polymorphs 1 $\alpha$  and 1 $\beta$  (Fig. 1) each contain a unique molecule of 2,2'-methylenebis(isoindoline-1,3-dione), which consists of two phthalimide groups and a methylene bridge. The phthalimide groups are nearly planar with maximum deviations of 0.029 (1) and 0.059 (1) Å for 1 $\alpha$ , and 0.040 (4) and 0.064 (3) Å for 1 $\beta$ . There are two degrees of freedom to characterize the molecular conformations of 1 $\alpha$  and 1 $\beta$ : these are the torsion angles C1—N1—C9—N2 [106.7 (1) and 117.4 (3) $^\circ$ , respectively] and N1—C9—N2—C10 [109.2 (1) and 117.6 (3) $^\circ$ , respectively]. Generally, the molecule of 1 $\beta$  deviates only slightly from that of 1 $\alpha$ , as indicated by a r.m.s. deviation of 0.368 Å (excluding all H atoms) (Fig. 2). The mean planes of the phthalimide rings for 1 $\beta$  make a dihedral angle of 76.12 (8) $^\circ$ , which is smaller than that of 88.96 (4) $^\circ$  observed in polymorph 1 $\alpha$ . The calculated density and Kitaigorodskii packing index (Spek, 2009) for 1 $\beta$  (1.469 Mg m $^{-3}$  and 70.0%) are slightly higher than those observed for 1 $\alpha$  (1.428 Mg m $^{-3}$  and 69.0%).

## 3. Supramolecular features

The crystal packing of 1 $\alpha$  features weak intermolecular C—H $\cdots$ O hydrogen bonds and  $\pi$ — $\pi$  interactions between neighboring phthalimide units. In the crystal structure of 1 $\beta$  (Fig. 3), the molecules are connected by weak intermolecular C—H $\cdots$ O hydrogen bonds (Table 1), forming a three-dimensional network. The crystal structure of 1 $\beta$  also features weak  $\pi$ — $\pi$

**Figure 2**  
An overlay diagram for the molecules of 1 $\alpha$  (red) and 1 $\beta$  (blue).

**Table 1**  
Hydrogen-bond geometry (Å,  $^\circ$ ).

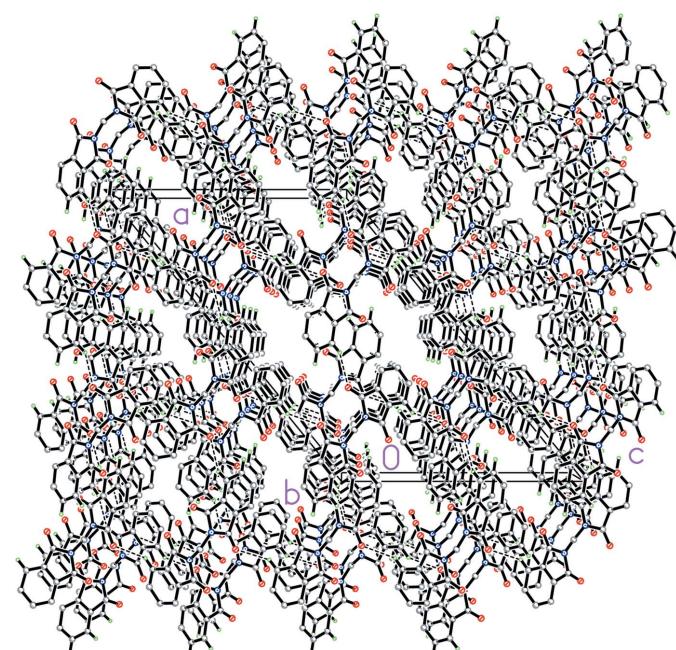

D—H $\cdots$ A	D—H	H $\cdots$ A	D $\cdots$ A	D—H $\cdots$ A
C3—H3A $\cdots$ O3 <sup>i</sup>	0.93	2.43	3.150 (6)	134
C4—H4A $\cdots$ O4 <sup>ii</sup>	0.93	2.60	3.300 (5)	133
C15—H15A $\cdots$ O2 <sup>iii</sup>	0.93	2.46	3.271 (7)	146

Symmetry codes: (i)  $x - \frac{1}{2}, -y + \frac{3}{2}, z - \frac{1}{2}$ ; (ii)  $-x, -y + 1, -z$ ; (iii)  $x, -y + 1, z + \frac{1}{2}$ .

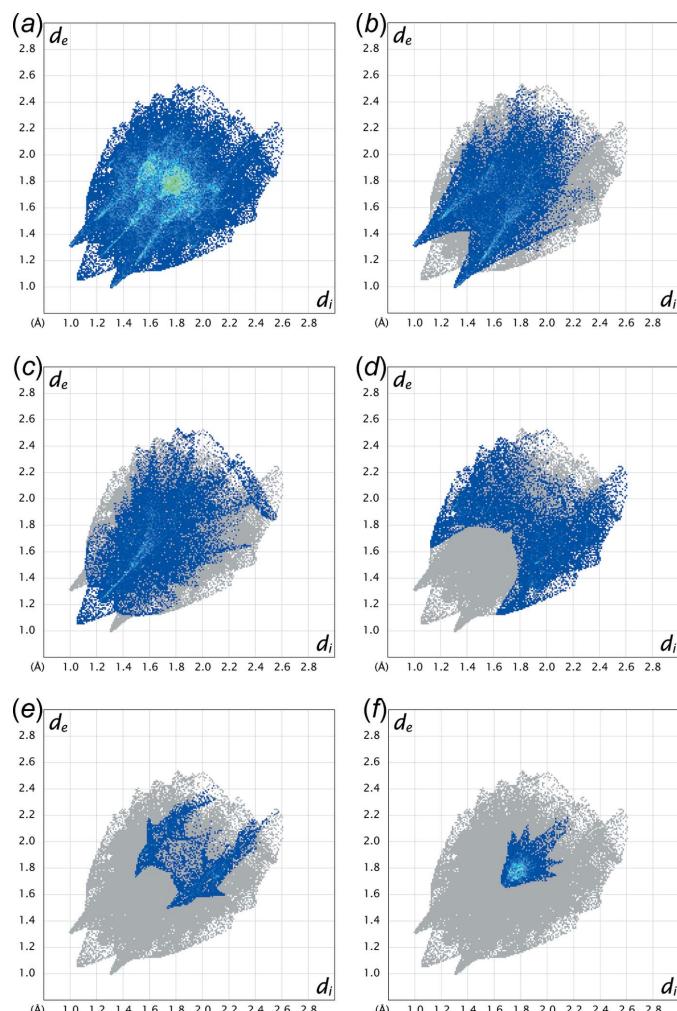

interactions between two C2—C7 phenyl rings (symmetry code:  $-x, -y + 1, -z$ ) and between N1/C1/C2/C7/C8 and C11—C16 rings (symmetry codes:  $-x + \frac{1}{2}, y + \frac{1}{2}, -z + \frac{1}{2}$  and  $-x + \frac{1}{2}, y - \frac{1}{2}, -z + \frac{1}{2}$ ), with centroid-to-centroid distances of 3.664 (3) and 3.938 (3) Å, respectively.

## 4. Hirshfeld surface analysis

The Hirshfeld surface analysis and two-dimensional fingerprint plots were performed using *CrystalExplorer* version 17.5 (Spackman & Jayatilaka, 2009; Spackman & McKinnon, 2002; Turner *et al.*, 2017). The H $\cdots$ O/O $\cdots$ H contact is the most populated contact and contributes 38.2 and 34.4% of the total intermolecular contacts of 1 $\alpha$  and 1 $\beta$  (Fig. 4), respectively. The large red spots on the Hirshfeld surface mapped over  $d_{\text{norm}}$  for 1 $\beta$  (Fig. 5) correspond to the intermolecular C3—H3A $\cdots$ O3 and C15—H15A $\cdots$ O2 hydrogen-bonds. The tips of the pseudo-mirrored sharp spikes at  $d_e + d_i \approx 2.32$  Å represent the shortest H $\cdots$ O/O $\cdots$ H contacts, corresponding to the intermolecular C3—H3A $\cdots$ O3 hydrogen-bond. The H $\cdots$ H contact is the second most populated contact and contributes

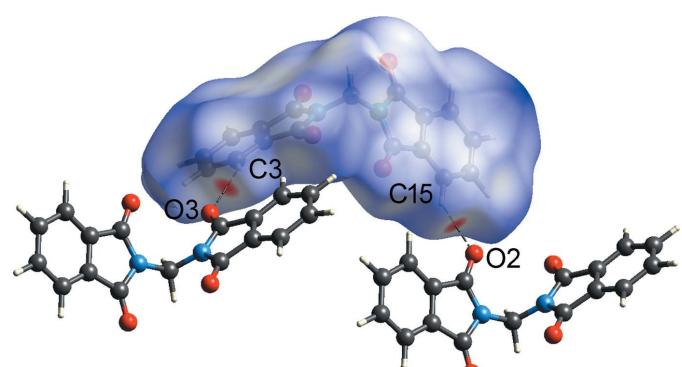

**Figure 3**

Computer programs: *APEX2* and *SAINT* (Bruker, 2009), *SHELXS2013* and *SHELXTL* (Sheldrick, 2008), *SHELXL2014* (Sheldrick, 2015), *Mercury* (Macrae *et al.*, 2008), *PLATON* (Spek, 2009) and *publCIF* (Westrip, 2010).

are illustrated as two sharp tips along the diagonal of their two-dimensional fingerprint plots at  $de \simeq di \simeq 1.06$  and 1.21 Å [Fig. 4(c)], respectively. The percentages of contribution of H···C/C···H, O···C/C···O and C···C contacts to the Hirshfeld surface are 20.6, 3.3 and 8.9%, respectively, for 1α, and 20.8, 7.9 and 6.7%, respectively, for 1β (Fig. 4). The absence of significant C–H···π interactions in the crystal structure of 1β is indicated by the absence of characteristic ‘wings’ in the fingerprint plot of H···C/C···H contacts [Fig. 4(d)]. The C···C contacts appear as a unique ‘triangle’ focused at  $de \simeq di \simeq 1.75$  Å [Fig. 4(f)]. The intermolecular π–π interactions are illustrated as unique patterns of red and blue ‘triangles’ on the shape-index surface (Fig. 6), and flat regions on the curvedness surface (Fig. 7), of the C2–C7, N1/C1/C2/C7/C8 and C11–C16 rings.

## 5. Lattice energy calculation

The C–H bond lengths in 1α and 1β were normalized to 1.08 Å and the lattice energies were calculated by using the *CLP-PIXEL* software package (Gavezzotti, 2003, 2008). The calculated lattice energy of 1α (130.3 kJ mol<sup>-1</sup>) is slightly larger than for 1β (128.5 kJ mol<sup>-1</sup>), indicating that 1α is slightly more stable than 1β under ambient conditions.

## 6. Synthesis and crystallization

Single crystals of 1β were obtained from an unsuccessful synthesis of 2-[(3-iodopyridin-4-yl)amino]methyl]isoindoline-1,3-dione by reacting *N*-(bromomethyl)phthalimide (1 mmol) and 4-amino-3-iodopyridine (1 mmol) in *N,N*-dimethylformamide (8 ml) with the presence of a catalytic amount of anhydrous potassium carbonate. The reaction solution was stirred for about 2 h at room temperature. Once the reaction was complete, the resultant mixture was poured into a beaker of ice-cooled water to obtain a precipitate (Then *et al.*, 2018), which was then filtered, washed with distilled water and dried. Crystals suitable for X-ray analysis were obtained by slow evaporation of a methanol solution.

## 7. Refinement

Crystal data, data collection and structure refinement details of 1β are summarized in Table 2. All H atoms were positioned geometrically (C–H = 0.93 and 0.97 Å) and refined using a riding model, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

## Funding information

QAW thanks the Malaysian Government and USM for the award of the post of Research Officer under the Research University Individual Grant (1001/PFIZIK/8011080). HCK, WZN and AJS thank the Malaysian Government for MyBrain15 scholarships.

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
