Symmetry codes: (i) $-x+1,-y,-z$; (ii) $x+1, y+1, z$.

## 2. Structural commentary

The title compound comprises a central naphthalene diimide with terminal thiopropyl chains (Fig. 1). The molecule lies on a crystallographic inversion center located at the centroid of the naphthalene ring system and the asymmetric unit is composed of one half of the molecule. As expected, the naphthalene diimide plane ( $\mathrm{N} 1 / \mathrm{C} 5 / \mathrm{O} 1 / \mathrm{C} 6 / \mathrm{C} 10 / \mathrm{C} 7 / \mathrm{C} 8 / \mathrm{C} 11 / \mathrm{C} 9 / \mathrm{O} 2$ ) is roughly planar with an r.m.s. deviation of $0.024 \AA$. The total distance between the terminal carbon atoms is 18.621 A . Furthermore, this molecule has an anti form as a result of the intramolecular $\mathrm{C} 4-\mathrm{H} 4 A \cdots \mathrm{O} 1$ and $\mathrm{C} 4-\mathrm{H} 4 A \cdots \mathrm{~S} 1$ hydrogen bonds (Table 1). The terminal methylthiopropylamine group is fixed at an $\mathrm{O} 1 \cdots \mathrm{H} 4 A \cdots \mathrm{~S} 1$ angle of $100.8^{\circ}$ by the aforementioned intramolecular hydrogen bonds. The C3/C2/S1/C1 section of the methylthiopropyl substituent is almost parallel to the naphthalene diimide unit with the $\mathrm{C} 3 / \mathrm{C} 2 / \mathrm{S} 1 / \mathrm{C} 1$ mean plane inclined to the naphthalene diimide plane at a dihedral angle of 13.1 (2) ${ }^{\circ}$.

## 3. Theoretical calculations

DFT calculations were performed using the GAUSSIAN09 software package (Frisch et al., 2009) and the calculated distances and angles were compared with experimental values from the X-ray diffraction studies. The overall structural calculation was performed using the B3LYP level theory with a $6-311^{++} G^{* *}$ basis set. The parameters optimized for bond lengths and bond angles are in close agreement with experimental crystallographic data (Table 2). The terminal methylthiopropyl group is fixed by internal hydrogen bonding in the crystal, whereas its internal hydrogen bonds are broken in the

Figure 1
The asymmetric unit of the title compound, with displacement ellipsoids drawn at the $50 \%$ probability level. H atoms are shown as small spheres of arbitrary radius and yellow and green dashed lines represent intramolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{S}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, respectively. Unlabelled atoms are generated by the symmetry operation $(-x+2$, $-y+1,-z$ ).

Table 2
Experimental and calculated bond lengths $(\AA)$.

| Bond | X-ray | B3LYP $\left(6-311++\mathrm{G}^{* *}\right)$ |
| :--- | :--- | :--- |
| O1-C5 | $1.210(3)$ | 1.2158 |
| O2-C9 | $1.221(3)$ | 1.2173 |
| N1-C4 | $1.471(3)$ | 1.4779 |
| N1-C5 | $1.404(3)$ | 1.4047 |
| N1-C 9 | $1.394(3)$ | 1.4029 |
| S1-C1 | $1.785(3)$ | 1.8244 |
| S1-C2 | $1.803(2)$ | 1.8399 |
| C2-C3 | $1.523(3)$ | 1.5301 |
| C3-C4 | $1.521(3)$ | 1.5341 |
| C5-C6 | $1.479(3)$ | 1.4880 |
| C6-C7 | $1.408(3)$ | 1.4135 |
| C7-C8 | $1.415(3)$ | 1.4136 |
| C8-C9 | $1.478(3)$ | 1.4877 |
| C6-C10 | $1.381(3)$ | 1.3835 |
| C8-C11 | $1.373(3)$ | 1.3835 |

gas-phase structural calculation. This can be confirmed by the fact that the $\mathrm{O} 1 \cdots \mathrm{H} 4 A \cdots \mathrm{~S} 1$ angle of the methylthiopropyl group has changed from 100.8 to $122.0^{\circ}$ (Fig. 2). However, even in the gas phase the molecule has an anti form similar to that found in the solid state.

## 4. Supramolecular features

In the crystal, $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{S}$ hydrogen bonds (Table 1) link the molecules, forming $R_{2}^{2}(11)$ and $R_{2}^{2}(10)$ rings (Fig. 3) and resulting in chains along the [220] direction. Adjacent chains are linked by intermolecular $\pi-\pi$ interactions between naphthalene diimide rings $[C g 1 \cdots C g 2=$ 3.5756 (12) $\AA ; C g 1$ and $C g 2$ are the centroids of the $\mathrm{C} 6 / \mathrm{C} 7 /$ $\mathrm{C} 7^{\mathrm{iii}} / \mathrm{C} 8^{\mathrm{iii}} / \mathrm{C} 10 / \mathrm{C} 11^{\text {iii }}$ and $\mathrm{C} 6^{\mathrm{iv}} / \mathrm{C} 7^{\mathrm{iv}} / \mathrm{C} 7^{\mathrm{v}} / \mathrm{C} 8^{\mathrm{v}} / \mathrm{C} 10^{\mathrm{iv}} / \mathrm{C} 11^{\mathrm{v}}$ rings, respectively; symmetry codes: (iii) $-x+2,-y+1,-z$; (iv) $-x+2,-y,-z$; (v) $x, y-1, z]$. These $\pi-\pi$ interactions lead to a two-dimensional network structure parallel to the (001) plane (Fig. 4). The network structures are stacked in an alternating $A B A B$ sequence along the $c$-axis direction (Fig. 5).

Figure 2
Atom-by-atom superimposition of the calculated structure (blue) using B3LYP/6-311++ $\mathrm{G}^{* *}$ and the X-ray structure (green) for the title compound.

Figure 3
Intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{S}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (yellow and green dashed lines) forming chains along the [2020] direction with $R_{2}^{2}(11)$ and $R_{2}^{2}(10)$ motifs.

Figure 4
A packing diagram for the title compound, showing the two-dimensional network formed by $\mathrm{C}-\mathrm{H} \cdots \mathrm{S}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (yellow and green dashed lines) and $\pi-\pi$ interactions (black dashed lines). H atoms not involved in intermolecular interactions have been omitted for clarity.

Figure 5
Packing diagrams of the title compound showing (a) the $A B A B$ stacking pattern and (b) the two-dimensional structure.

## 5. Hirshfeld surface analysis

Hirshfeld surface analysis was performed using CrystalExplorer (Turner et al., 2017) to quantify the various intermolecular interactions in the molecular packing of the title compound. The bright red dots in Fig. 6 showing the Hirshfeld surface mapped to the normalized contact distance ( $d_{\text {norm }}$ )

Table 3
Percentage contributions of interatomic contacts to the Hirshfeld surface of the title compound..

| Contact | Percentage contribution |
| :--- | :--- |
| $\mathrm{H} \cdots \mathrm{H}$ | 44.2 |
| $\mathrm{H} \cdots \mathrm{O} / \mathrm{O} \cdots \mathrm{H}$ | 18.3 |
| $\mathrm{H} \cdots \mathrm{C} / \mathrm{C} \cdots \mathrm{H}$ | 14.4 |
| $\mathrm{H} \cdots \mathrm{S} / \mathrm{S} \cdots \mathrm{H}$ | 10.2 |
| $\mathrm{C} \cdots \mathrm{O} / \mathrm{O} \cdots \mathrm{C}$ | 5.6 |
| $\mathrm{C} \cdots \mathrm{C}$ | 4.5 |
| $\mathrm{H} \cdots \mathrm{N} / \mathrm{N} \cdots \mathrm{H}$ | 1.4 |
| $\mathrm{O} \cdots \mathrm{O}$ | 0.5 |
| $\mathrm{~N} \cdots \mathrm{O} / \mathrm{O} \cdots \mathrm{N}$ | 0.4 |
| $\mathrm{C} \cdots \mathrm{S} / \mathrm{S} \cdots \mathrm{C}$ | 0.4 |

indicate the $R_{2}^{2}(11)$ and $R_{2}^{2}(10)$ loops, and the contact points of the intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{S}$ hydrogen bonds. The lighter red dot on the surface represents the $\pi-\pi$ interaction with adjacent molecules. The white and blue colours that make up the majority of the surface indicate contact distances that are equal to or greater than the van der Wails radii.

Figure 6
A view of the Hirshfeld surface of the title compound mapped over $d_{\text {norm }}$, showing the $\mathrm{H} \cdots \mathrm{S}$ and $\mathrm{H} \cdots \mathrm{O}$ contacts of the intermolecular interactions using a fixed colour scale of -0.2580 (red) to 1.0789 (blue) a.u.

Figure 7
(a) The full two-dimensional fingerprint plot for the title compound and those delineated into $(b) \mathrm{H} \cdots \mathrm{H},(c) \mathrm{H} \cdots \mathrm{O} / \mathrm{O} \cdots \mathrm{H},(d) \mathrm{H} \cdots \mathrm{C} / \mathrm{C} \cdots \mathrm{H}$ and (e) $\mathrm{H} \cdots \mathrm{S} / \mathrm{S} \cdots \mathrm{H}$ contacts. The $d_{\mathrm{i}}$ and $d_{\mathrm{e}}$ values are the closest internal and external distances (in $\AA$ ) from given points on the Hirshfeld surface contacts.

The $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{S}$ hydrogen bonds and $\pi-\pi$ stacking interactions are identified in the two-dimensional fingerprint plots (Fig. 7a-e), which show the $\mathrm{H} \cdots \mathrm{H}, \mathrm{H} \cdots \mathrm{C} /$ $\mathrm{C} \cdots \mathrm{H}, \quad \mathrm{H} \cdots \mathrm{O} / \quad \mathrm{O} \cdots \mathrm{H}, \quad \mathrm{H} \cdots \mathrm{N} / \mathrm{N} \cdots \mathrm{H}$, and $\mathrm{H} \cdots \mathrm{S} / \mathrm{S} \cdots \mathrm{H}$ contacts. The relative contributions of the atomic contacts to the Hirshfeld surface are summarized in Table 3. These show that the dominant interaction, accounting for $44.2 \%$ of the surface, is the $\mathrm{H} \cdots \mathrm{H}$ van der Waals interaction. Substantial contributions are also made by $\mathrm{H} \cdots \mathrm{O} / \mathrm{O} \cdots \mathrm{H}(18.3 \%), \mathrm{H} \cdots \mathrm{C} /$ $\mathrm{C} \cdots \mathrm{H}(14.4 \%)$, and $\mathrm{H} \cdots \mathrm{S} / \mathrm{S} \cdots \mathrm{H}(10.2 \%)$ contacts, which are indicated by two sharp peaks in each fingerprint plot. Lesser contributions from $\mathrm{C} \cdots \mathrm{O} / \mathrm{O} \cdots \mathrm{C}, \mathrm{C} \cdots \mathrm{C}, \mathrm{H} \cdots \mathrm{N} / \mathrm{N} \cdots \mathrm{H}$, $\mathrm{O} \cdots \mathrm{O}, \mathrm{N} \cdots \mathrm{O} / \mathrm{O} \cdots \mathrm{N}$, and $\mathrm{C} \cdots \mathrm{S} / \mathrm{S} \cdots \mathrm{C}$ contacts are included in Table 3 for completeness.

## 6. Synthesis and crystallization

A mixture of 1,4,5,8-naphthalenetetracarboxylic dianhydride $(6.70 \mathrm{~g}, \quad 25.0 \mathrm{mmol})$ and 3 -(methylsulfanyl)propylamine ( $5.6 \mathrm{~mL}, 50.0 \mathrm{mmol}$ ) in toluene ( 5 mL ) and quinoline ( 15 mL ) was heated at 453 K with stirring for 1 h . Upon cooling to room temperature, a golden yellow crude solid was filtered off and washed with diethyl ether. A golden yellow powder was obtained. Crystals suitable for X-ray diffraction analysis were obtained by slow evaporation of a dichloromethane solution of the title compound.
${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 8.77(s, 2 \mathrm{H}, \mathrm{Ar}), 4.33(t, 2 \mathrm{H}$, $\left.\mathrm{CH}_{2} \mathrm{~N}\right), 2.64\left(t, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.14\left(s, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.07\left(t, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{~S}\right)$. ${ }^{13} \mathrm{C}$ NMR (75.4 MHz, $\mathrm{CDCl}_{3}$ ): $\delta 162.81,130.99,126.69,126.57$, $40.01,31.61,27.16$ and 15.31. IR ( $\mathrm{v}, \mathrm{cm}^{-1}$ ): $3344(\mathrm{~m}) ; 3071(\mathrm{~m})$; 2916 ( $s$ ) ; 2848 ( $s$ ); 1999 ( $s) ; 1693$ ( $s$ ).

## 7. Database survey

A search of the Cambridge Structural Database (CSD, Version 5.40, updated February 2019; Groom et al., 2016) for naphthalene diimide derivatives gave 31 hits for structures that include a terminal propyl group. The title compound was not found. Related compounds include a series of cycloalkylsubstituted naphthalene tetracarboxylic diimides (Kakinuma et al., 2013). Other terminal $n$-alkyl groups are known with 2,7-dibutylbenzo [lmn][3,8]phenanthroline-1,3,6,8-tetraone (Alvey et al., 2010), bis- $N, N^{\prime}$-dipentylnaphthalene-1,4,5,8tetracarboxylic diimide (Andric et al., 2004), $N, N^{\prime}$-di- $n$-hexyl-1,4;5,8-naphthalenetetracarboxylic diimide (Ofir et al., 2006), and $\quad N, N^{\prime}$-di(n-dodecyl)naphthalene-4,5,8,9-tetracarboxylic acid diimide (Kozycz et al., 2015).

## 8. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 4. All H atoms were positioned geometrically and refined using a riding model with $d(\mathrm{C}-\mathrm{H})$ $=0.95 \AA, U_{\text {iso }}=1.2 U_{\text {eq }}(\mathrm{C})$ for aromatic, $d(\mathrm{C}-\mathrm{H})=0.99 \AA$, $U_{\text {iso }}=1.2 U_{\text {eq }}(\mathrm{C})$ for methylene, and $d(\mathrm{C}-\mathrm{H})=0.98 \AA, U_{\text {iso }}=$ $1.5 U_{\text {eq }}(\mathrm{C})$ for the methyl H atoms.

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
