The syntheses and crystal structures of the title compounds, C<sub>14</sub>H<sub>8</sub>F<sub>4</sub>N<sub>2</sub>O<sub>2</sub> and C<sub>14</sub>H<sub>8</sub>F<sub>4</sub>N<sub>2</sub>O<sub>3</sub>, are reported. In each crystal, the packing is driven by C—H···F intertactions, along with a variety of C—H···O, C—O···π, and C—F···π contacts. Hirshfeld surface analysis was conducted to aid in the visualization of these various influences on the packing: they showed that the largest contributions to the surface contacts arise from H···F/F···H interactions, followed by H···H and O···H/H···O.

## 1. Chemical context

Polynorbornenes (PNBs), derived from ring-opening metathesis polymerization reactions, are numerous, owing to their relative ease of synthesis, tolerance of diverse functional groups and high-molecular weights with good processability (Isono *et al.*, 2018). The use of dicarboxyimide-substituted norbornenes allows synthetic control of the substituents on the norbornene ring system, and this feature has been exploited for polymer light-emitting diodes (Zeng *et al.*, 2018) and gas-separation membranes (Yu *et al.*, 2016). With its predictable substitution chemistry (Baker & Muir, 2010; Chambers *et al.*, 1988), perfluoropyridine was added to two dicarboxyimide-norbornene systems, and the resulting crystal structures are herein reported.

nitrogen–*ipso*-carbon bond (C3–N2 and C17–N4 in the crystal): this is evidenced by separate <sup>19</sup>F NMR peaks in solution for the *ortho*-F atoms (F2/F7 and F3/F6 in the crystal). In molecule **A**, the N1/C1–C5 plane is rotated by 58.05 (5)° relative to the N2/C6/C7/C12/C13 plane and the corresponding dihedral angle for molecule **B** is 61.65 (7)°. The addition of an oxygen atom between N2 and C3 in **II** alleviates this steric restriction and only one <sup>19</sup>F NMR peak in solution is observed for the *ortho*-F atoms; even so, the dihedral angle between the N1/C1–C5 and N2/C6/C7/C12/C13 planes in the crystal of **II** of 84.01 (5)° is larger than those found in **I**.

### 3. Supramolecular features and Hirshfeld surface analysis

The main directional interactions in the crystal structures of **I** and **II** are of the type C–H···O, C–H···F, C–O···π, and C–F···π (Tables 1 and 2). In both compounds, weak hydrogen-bonding interactions are observed for the hydrogen atom(s) α to the carbonyl groups (C7–H6···O1<sup>i</sup>, C12–H12···F2<sup>iii</sup>, C21–H21···F7<sup>iii</sup>, C21–H21···O3<sup>iv</sup> and C26–H26···O4<sup>v</sup> in **I**; C7–H7···O2<sup>i</sup> in **II**) and the olefinic hydrogen atoms (C9–H9···F4<sup>ii</sup> in **I**; C9–H9···O3<sup>ii</sup> in **II**). A weak interaction is also observed for a bridge hydrogen atom in **II**, C14–H14B···F4<sup>iii</sup>. The packing is further aided by π-interactions with the pyridine ring (C6–O1···Cg<sup>i</sup>, C13–O2···Cg<sup>vi</sup> and C27–O4···Cg<sup>ii</sup> in **I**; C5–F4···Cg<sup>iv</sup> and C13–O3···Cg<sup>v</sup> in **II**).

Hirshfeld surface analysis (Spackman & Jayatilaka, 2009) was used to investigate the presence of hydrogen bonds and other intermolecular interactions in the crystal structures. The analyses and associated two-dimensional fingerprint plots (Fig. 3) (Spackman & McKinnon, 2002) were generated with *CrystalExplorer17.5* (Turner *et al.*, 2017) using a standard surface resolution with the three-dimensional  $d_{\text{norm}}$  surfaces plotted over a fixed color scale of –0.02500 (red) to 1.3800 (blue) a.u. The pale-red spots symbolize short contacts and negative  $d_{\text{norm}}$  values on the corresponding surface plots shown in Fig. 2, associated with their relative contributions to the Hirshfeld surface.

The largest contribution to the overall crystal packing in both compounds is from F···H/H···F interactions (36.5% in **I**; 39.2% in **II**; Table 3). The F···H/H···F contacts appear as a pair of characteristic tips in the fingerprint plots at 0.95 Å <

H...H contacts make the second largest contribution (20.2% in **I** and 14.1% in **II**), shown in the middle region  $1.10 \text{ \AA} < (d_i + d_e) < 1.18 \text{ \AA}$  in **I** and **II**. #### 4. Database survey

A search of the November 2018 release of the Cambridge Structure Database (Groom *et al.*, 2016), with updates through May 2019, was performed using the program *ConQuest* (Bruno *et al.*, 2002). The search was limited to organic structures with  $R \leq 0.1$ . A search for tetrahydro-1*H*-4,7-methanoisindole-1,3(2*H*)-dione-based compounds with an aromatic substituent on the nitrogen atom yielded 58 results. The dihedral angle between the aromatic ring plane and the succinimide plane is bimodally distributed between 43 and 90°, with peaks near 60 and 75°.

## 5. Synthesis and crystallization

**Synthesis of (I):** pentafluoropyridine (2.68 ml, 24.5 mmol), (3*aR*,4*S*,7*R*,7*aS*)-3*a*,4,7,7*a*-tetrahydro-1*H*-4,7-methanoisoindole-1,3(2*H*)-dione (4.0 g, 24.5 mmol), and triethylamine (8.56 ml, 61.2 mmol) were combined in DMF (150 ml). The resulting solution was stirred at room temperature for 24 h. Diethyl ether (150 ml) and saturated aqueous ammonium chloride (100 ml) were added and the biphasic solution stirred vigorously for 2 h. The organic layer was separated and the remaining aqueous portion extracted with diethyl ether (2 × 150 ml). The combined organic fractions were washed with water (2 × 1 l) and brine (2 × 300 ml), dried over MgSO<sub>4</sub>, and the solvent removed *via* rotary evaporation. The resulting off-white solid was dissolved in refluxing EtOH (20 ml) and cooled to 278 K for 12 h. Vacuum filtration, washing with cold EtOH (20 ml), and vacuum drying afforded the target compound as a white, crystalline solid (6.18 g, 81%). <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>): 6.28 (*s*, 2H), 3.58 (*s*, 2H), 3.54 (*s*, 2H), 1.74 (*dd*, 2H, *J* = 96, 9.0 Hz). <sup>19</sup>F NMR (471 MHz, CDCl<sub>3</sub>): -90.5 (2F), -141.7 (1F), -143.1 (1F).

**Synthesis of (II):** to a stirred solution of potassium carbonate (1 *M*, 140 ml), (3*aR*,4*S*,7*R*,7*aS*)-2-hydroxy-3*a*,4,7,7*a*-tetrahydro-1*H*-4,7-methanoisoindole-1,3(2*H*)-dione (10.0 g, 55.9 mmol), pentafluoropyridine (6.1 ml, 56 mmol), and 140 ml of DMF were added. The resulting solution was stirred at room temperature for 24 h. Diethyl ether (150 ml) and saturated aqueous ammonium chloride (100 ml) were added and the biphasic solution stirred vigorously for 2 h. The organic layer was separated and the remaining aqueous

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
