*Correspondence e-mail: sugiyama.h.ad@keio.jp

In the paper by Sugiyama [*Acta Cryst.* (2020), **E76**, 742–746], there is an error in the chemical names of the title compounds.

The chemical names of the title compounds in the paper by Sugiyama (2012) are incorrect. The title should read ‘Hydrogen-bonding patterns in pyridinium 2,2-bis(4-carboxyphenyl)hexafluoropropane and ethylenediammonium salt crystals’, and ‘2,2-bis(4-methylphenyl)hexafluoropropane’ should be ‘2,2-bis(4-carboxyphenyl)hexafluoropropane’ throughout. The systematic names of the compounds in the *Abstract* are correct.

The crystal structures of two salt crystals of 2,2-bis(4-methylphenyl)hexafluoropropane (Bmphfp) with amines, namely, dipyridinium 4,4'-(1,1,1,3,3,3-hexafluoropropane-2,2-diyl)dibenzoate 4,4'-(1,1,1,3,3,3-hexafluoropropane-2,2-diyl)-dibenzoic acid, $2\text{C}_5\text{H}_6\text{N}^+\cdot\text{C}_{17}\text{H}_8\text{F}_6\text{O}_4^{2-}\cdot\text{C}_{17}\text{H}_8\text{F}_6\text{O}_4$, (**1**), and a monohydrated ethylenediammonium salt ethane-1,2-diaminium 4,4'-(1,1,1,3,3,3-hexafluoropropane-2,2-diyl)dibenzoate monohydrate, $\text{C}_2\text{H}_{10}\text{N}_2^{2+}\cdot\text{C}_{17}\text{H}_8\text{F}_6\text{O}_4^{2-}\cdot\text{H}_2\text{O}$, (**2**), are reported. Compounds **1** and **2** crystallize, respectively, in space group $P2_1/c$ with $Z' = 2$ and in space group $Pbca$ with $Z' = 1$. The crystals of compound **1** contain neutral and anionic Bmphfp molecules, and form a one-dimensional hydrogen-bonded chain motif. The crystals of compound **2** contain anionic Bmphfp molecules, which form a complex three-dimensional hydrogen-bonded network with the ethylenediamine and water molecules.

1. Chemical context

In recent years, porous organic frameworks have been researched extensively because of their structural versatility and potential applications in gas storage and separation and as catalysts and chemical sensors (He *et al.*, 2011). Hydrogen-bonded organic frameworks (HOFs), which are constructed *via* intermolecular hydrogen bonds, are being actively investigated for such applications (Hisaki *et al.*, 2018). HOFs are basically flexible to allow solution-based fabrication/reassembly and dynamic structural conversion as compared to covalent organic frameworks (COFs) (Miyano *et al.*, 2016). Several multiple-carboxylic acids are reported to create HOFs *via* carboxylic dimers (Bassanetti *et al.*, 2016; Hisaki, 2020). 2,2-Bis(4-methylphenyl)hexafluoropropane (Bmphfp) is a V-shaped di-carboxylic acid forming a one-dimensional hydrogen-bonded chain in the crystal structure (Tang *et al.*, 2010). The HOFs based on carboxylic acids can be modified or rebuilt by salt formation with various organic bases (Galcerá *et al.*, 2012).

The crystal structures of Bmphfp pyridinium (**1**) and ethylenediammonium (**2**) salts are reported herein with a focus on the differences in the hydrogen-bonding patterns.

2. Structural commentary

Compound **1** crystallizes in the monoclinic space group $P2_1/c$ with two Bmphfp molecules and two pyridinium cations in the asymmetric unit (Fig. 1*a*). Interestingly, one of the two Bmphfp molecules is neutral and the other is anionic. The C—O bond lengths of the carboxy groups are summarized in Table 1, which suggests that molecules *A* and *B* are in the neutral and divalent anionic forms, respectively. The two benzene rings are twisted with respect to each other, forming dihedral angles of 72.19 (6) and 69.98 (6) $^{\circ}$. On the other hand, compound **2** crystallizes in the orthorhombic space group $Pbcn$. The asymmetric unit comprises one Bmphfp anion, one ethylenediammonium cation and one water molecule (Fig. 1*b*). The C—O bond lengths shown in Table 1 confirm that the Bmphfp molecule is in the divalent anionic form. The benzene rings are twisted with a dihedral angle of 64.47 (6) $^{\circ}$. The N—C—C—N torsion angle in the ethylenediammonium cation is 72.72 (14) $^{\circ}$.

3. Supramolecular features

In the crystal of compound **1**, the pyridine molecules form strong N—H···O hydrogen bonds with the carboxyl groups of Bmphfp molecule *B* (Table 2, Fig. 2*a*). The neutral (*A*) and anionic (*B*) Bmphfp molecules form a one-dimensional

hydrogen-bonded chain motif along the *a*-axis direction (Fig. 2*b*). The lengths of the negative charge-assisted O—H···O hydrogen bonds, 2.5732 (13) and 2.5125 (13) \AA , are shorter than in the common carboxyl dimer [2.643 \AA ; the mean value calculated from 505 research hits in the Cambridge Structural Database (CSD version 5.41, November 2019 update; Groom *et al.*, 2016)]. Fig. 2*c* shows the crystal packing of compound **1**. The pyridine molecules are located between the hydrogen-bonded chains of Bmphfp molecules. There are weak C—H···F and F···F interactions between the Bmphfp and pyridine molecules or between Bmphfp molecules. The shortest interatomic distances are 3.159 (1) \AA (C···F) and 2.696 (1) \AA (F···F), respectively.

In the crystal of compound **2**, one carboxylic group of the Bmphfp molecule is linked to an ethylenediammonium cation by two N—H···O hydrogen bonds. The N···O interatomic distances are 2.7749 (14) and 2.8015 (14) \AA , respectively (Table 3). The other carboxylic group forms N—H···O

**Figure 2**Crystal structure of compound **1**. (a) Hydrogen bonds between the Bmphfp and pyridine molecules. (b) hydrogen-bonded chain of Bmphfp molecules. (c) Molecular packing along the *b*-axis direction.

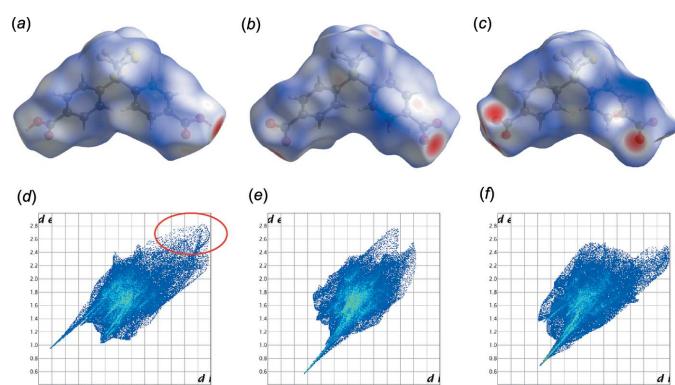

**Figure 3**

Crystal structure of compound 2. (a) Hydrogen bonds between Bmphfp, ethylenediamine, and water molecules. (b) Hydrogen bonds between Bmphfp and ethylenediamine molecules.

hydrogen bonds with three surrounding ethylenediammonium cations (Fig. 3a). Therefore, five of the six hydrogen-atom donors of the ethylenediammonium cations are connected to Bmphfp molecules, resulting in a complex three-dimensional hydrogen-bonding network. The water molecule is linked to both Bmphfp and ethylenediamine molecules *via* two O—H···O and one N—H···O hydrogen bonds. Thus, the water molecules are highly stabilized by these intermolecular interactions in the crystal structure (Fig. 3b). Weak C—H···F and F···F interactions are observed between Bmphfp molecules, resulting in interatomic distances of 3.493 (1) Å (C···F) and 2.890 (1) Å (F···F), respectively. In compound 2, the Bmphfp molecules do not form a discrete 1-D hydrogen bond chain motif as observed in compound 1 because the one carboxyl group is terminated by an ethylenediamine molecule.

4. Hirshfeld surface analysis

Hirshfeld surfaces (McKinnon *et al.*, 2007) and their associated two-dimensional fingerprint plots (Spackman & McKinnon, 2002) were calculated using *CrystalExplorer17* (Turner *et al.*, 2017). The d_{norm} surface of the Bmphfp molecules in compounds 1 and 2 are shown in Fig. 4a–c. The red colour highlights the surface areas where there are strong interactions such as O—H···O hydrogen bonds. In compound 1, there are two independent Bmphfp molecules, A and B.

**Figure 4**

Hirshfeld surface mapped over d_{norm} of (a) Bmphfp molecule A and (b) Bmphfp molecule B in compound 1, and (c) the Bmphfp molecule in compound 2. Two-dimensional fingerprint plots of these Bmphfp molecules are shown in (d)–(f), respectively.

Table 4
Percentage contributions to the Hirshfeld surface of the Bmphfp molecule A in compound 1.

Inside	Outside	F	O	H	N	O	Total
C		3.5	0.5	7.9	0.4	1.3	13.6
F		6.0	0.7	16.5		3.6	26.9
H		12.0	8.2	18.7	0.3	2.5	41.8
O		0.3	0.8	14.8	0.5	1.3	17.7
Total		21.9	10.3	57.8	1.3	8.8	

Table 5
Percentage contributions to the Hirshfeld surface of the Bmphfp molecule B in compound 1.

Inside	Outside	F	O	H	N	O	Total
C		4.9	0.1	5.0	0.9	3.9	14.9
F		6.1		17.1		3.4	26.3
H		12.0	2.3	17.1	0.2	3.5	35.0
O		0.6	0.7	21.4	0.1	0.7	23.6
Total		23.5	3.2	60.7	1.2	11.4	

Table 6
Percentage contributions to the Hirshfeld surface of the Bmphfp molecule in compound 2.

Inside	Outside	F	O	H	O	Total
C		2.9	0.7	10.5	0	14.2
F		26.9	0.6	16.9	2.5	27.0
H		11.7	2.3	17.6	2.5	34.1
O		0.2	0.6	23.6	0.3	24.7
Total		221.8	4.3	68.6	5.3	

There is no significant difference in the contact contributions of each of the molecules (Tables 4 and 5). However, in the fingerprint plots, molecule B has no contribution from contacts with a long interatomic distance (highlighted by the red circle in Fig. 4a) compared to molecule A. Thus, molecule B is more closely packed with the surrounding molecules in the crystal than molecule A. This may be due to the difference in the ionic state between neutral molecule A and anionic molecule B. Compound 1 (molecule A and B) has strong hydrogen-bonding interactions, with similar but slightly weaker interactions for compound 2. The contributions to the Hirshfeld surface for 2 are listed in Table 6.

5. Database survey

A search of the Cambridge Structural Database (CSD version 5.41, November 2019 update; Groom *et al.*, 2016) for crystal structures with 2,2-bis(4-methylphenyl)hexafluoropropane gave 244 hits. Two polymorphs of Bmphfp, TUPNOI (Tang *et al.*, 2010) and TUPNOI01 (Pachfule *et al.*, 2010), have been reported. In both crystal structures, the Bmphfp molecules form similar one-dimensional hydrogen-bonding motifs *via* carboxylic dimers. However, there is only one structure of a Bmphfp organic salt with 1,4-bis(2-pyridylaminometh-

yl)benzene (EFOLIW; Tripuramallu, 2014). Other results are inorganic salts or metal complex salts (WAQTUF; Platero-Prats *et al.*, 2012) including metal–organic frameworks (KUXRAX; Prats *et al.*, 2010; Platero-Prats *et al.*, 2010; AVILAT; Wang *et al.*, 2011).

6. Synthesis and crystallization

The reagents 2,2-bis(4-methylphenyl)hexafluoropropane, pyridine and ethylenediamine were purchased from TCI Co., Ltd. (Japan). 2,2-Bis(4-methylphenyl)hexafluoropropane (2.5 mmol, 0.083 g) was dissolved in methanol 10 mL. The Bmpfhp solution was mixed into 5 mL of a 1.0 M pyridine methanol solution under stirring. After slow evaporation, colourless plate-like crystals of compound **1** were obtained. When the Bmpfhp solution was mixed into 5 ml of a 1.0 M ethylenediamine methanol solution under stirring, colourless needle-like crystals of compound **2** were obtained.

7. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 7. H atoms were positioned geometrically and refined using a riding model: C—H = 0.93, O—H = 0.82, Nsp²—H = 0.86, Nsp³—H = 0.89 Å with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C, N, O})$.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters (\AA^2)

Ethane-1,2-diaminium 4,4'-(1,1,1,3,3,3-hexafluoropropane-2,2-diyl)dibenzoate monohydrate (2)*Crystal data*

$M_r = 470.37$

Orthorhombic, $Pbca$

$a = 13.2518$ (3) Å

$b = 12.1773$ (3) Å

$c = 25.8419$ (6) Å

$V = 4170.14$ (17) Å³

$Z = 8$

$F(000) = 1936$

$D_x = 1.498$ Mg m⁻³

Cu $K\alpha$ radiation, $\lambda = 1.54184$ Å

Cell parameters from 9861 reflections

$\theta = 3.4\text{--}75.7^\circ$

$\mu = 1.26$ mm⁻¹

$T = 93$ K

Needle, colourless

0.22 × 0.1 × 0.05 mm

Data collection

XtaLAB Synergy R, DW system, HyPix
diffractometer

Radiation source: Rotating-anode X-ray tube,
Rigaku (Cu) X-ray Source

Mirror monochromator

Detector resolution: 10.0000 pixels mm⁻¹

ω scans

Absorption correction: multi-scan
(CrysAlisPro; Rigaku OD, 2019)

$T_{\min} = 0.855$, $T_{\max} = 0.940$

15896 measured reflections

4198 independent reflections

3809 reflections with $I > 2\sigma(I)$

$R_{\text{int}} = 0.029$

$\theta_{\max} = 76.3^\circ$, $\theta_{\min} = 3.4^\circ$

$h = -6 \rightarrow 16$

$k = -14 \rightarrow 15$

$l = -32 \rightarrow 29$

Refinement

Refinement on F^2

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.032$

$wR(F^2) = 0.082$

$S = 1.04$

4198 reflections

294 parameters

0 restraints

Primary atom site location: dual

Hydrogen site location: mixed

H-atom parameters constrained

$w = 1/[\sigma^2(F_o^2) + (0.0378P)^2 + 1.7828P]$

where $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} < 0.001$

$\Delta\rho_{\max} = 0.29$ e Å⁻³

$\Delta\rho_{\min} = -0.24$ e Å⁻³

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters (Å²)
