The title compound, $[\text{Mn}(\text{C}_3\text{H}_7\text{NO})_4(\text{H}_2\text{O})_2][\text{Cu}_5(\text{C}_7\text{H}_4\text{NO}_3)_4]\cdot\text{C}_3\text{H}_7\text{NO}$ or *cis*- $[\text{Mn}(\text{H}_2\text{O})_2(\text{DMF})_4][\text{Cu}[12-\text{MC}_{\text{Cu}(\text{II})\text{N}(\text{shi})}-4]]\cdot\text{DMF}$, where MC is metallacrown, shi³⁻ is salicylhydroximate, and DMF is *N,N*-dimethylformamide, crystallizes in the monoclinic space group $P2_1/n$. Two crystallographically independent metallacrown anions are present in the structure, and both anions exhibit minor main molecule disorder by an approximate (non-crystallographic) 180° rotation with occupancy ratios of 0.9010 (9) to 0.0990 (9) for one anion and 0.9497 (8) to 0.0503 (8) for the other. Each pentacopper(II) metallacrown contains four Cu^{II} ions in the MC ring and a Cu^{II} ion captured in the central cavity. Each Cu^{II} ion is four-coordinate with a square-planar geometry. The anionic $[\text{Cu}[12-\text{MC}_{\text{Cu}(\text{II})\text{N}(\text{shi})}-4]]^{2-}$ is charged-balanced by the presence of a *cis*- $[\text{Mn}(\text{H}_2\text{O})_2(\text{DMF})_4]^{2+}$ cation located in the lattice. In addition, the octahedral Mn^{II} counter-cation is hydrogen bonded to both MC anions *via* the coordinated water molecules of the Mn^{II} ion. The water molecules form hydrogen bonds with the phenolate and carbonyl oxygen atoms of the shi³⁻ ligands of the MCs.

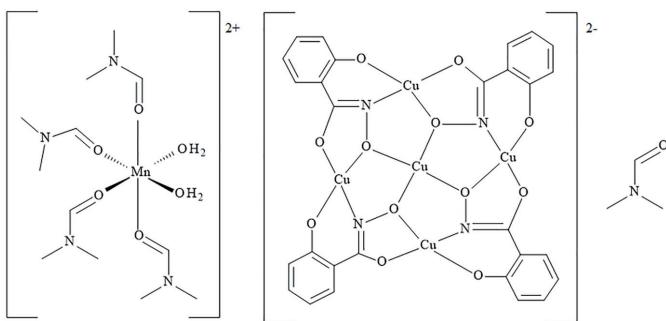

1. Chemical context

Pentacopper(II) 12-metallacrown-4 complexes are ubiquitous in metallacrown (MC) chemistry (Mezei *et al.*, 2007; Tegoni & Remelli, 2012; Ostrowska *et al.*, 2016). A survey of the Cambridge Structural Database (CSD version 5.41, update March 2020; Groom *et al.*, 2016) reveals that there are 35 different structures; however, even more Cu₅ 12-MC-4 complexes have been studied in solution to understand the thermodynamic properties of their self-assembly (Mezei *et al.*, 2007; Tegoni & Remelli, 2012; Ostrowska *et al.*, 2016). Initially Cu₅ 12-MC-4 complexes were only produced with ligands that could form fused five- and six-membered chelate rings such as salicylhydroxamic acid or β -aminohydroxamic acids (Orama *et al.*, 1992; Gibney *et al.*, 1994; Halfen *et al.*, 1998); however, it is now recognized that α - and γ -aminohydroxamic acids can form Cu₅ 12-MC-4 complexes that have fused five- and five-membered chelate rings or fused five- and seven-membered chelate rings, respectively (Dallavalle *et al.*, 2001; Tegoni *et al.*, 2004, 2007, 2008). Pentacopper(II) 12-MC-4 complexes have applications as templates for the assembly of peptide bundles (Cal *et al.*, 2013), for the sorption of gases and alcohols (Atzeri *et al.*, 2016; Pavlishchuk *et al.*, 2017), and as building blocks for one-, two-, and three-dimensional materials (Bodwin & Pecoraro, 2000; Gumienka-Kontecka *et al.*, 2007; Lago *et al.*,

OPEN ACCESS

2011; McDonald *et al.*, 2013; Atzeri *et al.*, 2016). To date only four other structures have been reported with the metallacrown framework ligand salicylhydroxamic acid (H_3shi): $A_2[\text{Cu}[12\text{-MC}_{\text{Cu}(\text{II})\text{N}(shi)}\text{-}4]]$, where A is either tetramethylammonium (Gibney *et al.*, 1994), $[\text{Na}(15\text{-crown-5})]^+$ (Gibney *et al.*, 1994), tetraethylammonium (Herring *et al.*, 2011), or triethylammonium (Happ & Rentschler, 2014). Herein we report the first use of a $3d$ metallic counter-cation to the pentacopper(II) metallacrown: $cis\text{-}[\text{Mn}(\text{H}_2\text{O})_2(\text{DMF})_4]\text{-}[\text{Cu}[12\text{-MC}_{\text{Cu}(\text{II})\text{N}(shi)}\text{-}4]]\cdot\text{DMF}$.

2. Structural commentary

Two crystallographically independent metallacrown anions are present in the structure, and both are located on crystallographic inversion centers with the central copper ions situated on the inversion center (Figs. 1 and 2). Both anions exhibit minor main-molecule disorder by an approximate (non-crystallographic) 180° rotation with an occupancy ratio of 0.9010 (9) to 0.0990 (9) for the anion associated with Cu1 and an occupancy ratio 0.9497 (8) to 0.0503 (8) for the anion associated with Cu4. Thus, only the structures of the main

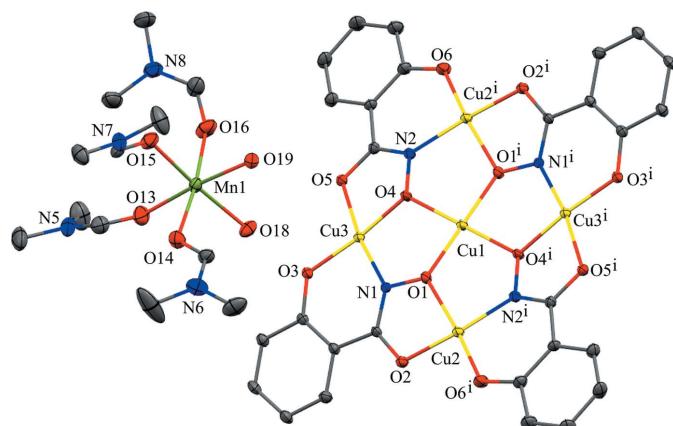

Figure 1

The single-crystal X-ray structure of the ionic pair $cis\text{-}[\text{Mn}(\text{H}_2\text{O})_2(\text{DMF})]\text{-}[\text{Cu}[12\text{-MC}_{\text{Cu}(\text{II})\text{N}(shi)}\text{-}4]]\cdot\text{DMF}$ associated with Cu1 and with displacement ellipsoids at the 50% probability level [symmetry code: (i) $2 - x, -y, 1 - z$]. For clarity, only non-carbon atoms have been labeled, and the MC associated with Cu4, the lattice DMF molecule, H atoms, and disorder have been omitted. Color scheme: yellow – Cu^{II} , green – Mn^{II} , red – oxygen, blue – nitrogen, and gray – carbon. All figures were generated with the program *Mercury* (Macrae *et al.*, 2020).

Table 1

Average bond-length (\AA) and bond-valence-sum (BVS; v.u.) values used to support the assigned oxidation states of the copper and manganese ions.

	Avg. bond length	BVS value	Assigned oxidation state
Mn1	2.171	2.01	2+
Cu1	1.896	2.05	2+
Cu2	1.914	2.11	2+
Cu3	1.921	2.08	2+
Cu4	1.892	2.08	2+
Cu5	1.922	2.07	2+
Cu6	1.912	2.12	2+

moieties will be discussed. The metallacrowns have an overall square shape as a result of the fused five- and six-membered chelate rings of the salicylhydroximate (shi^{3-}) ligands, and the MCs are slightly non-planar. In each MC, a copper ion is captured in the central cavity and surrounded by four copper ions of the MC ring. The MC ring has a $\text{Cu}-\text{N}-\text{O}$ pattern that repeats four times to generate the MC central cavity. All five copper ions of each MC are assigned a 2+ oxidation state based on bond-valence-sum (BVS) values (Liu & Thorp, 1993), average bond length distances, and overall charge-balance considerations (Table 1). In addition, all five Cu^{II} ions of each MC are four-coordinate, and a SHAPE (SHAPE 2.1; Llunell *et al.*, 2013) analysis of the geometry yields the lowest continuous shape measure (CShM) values for square planar

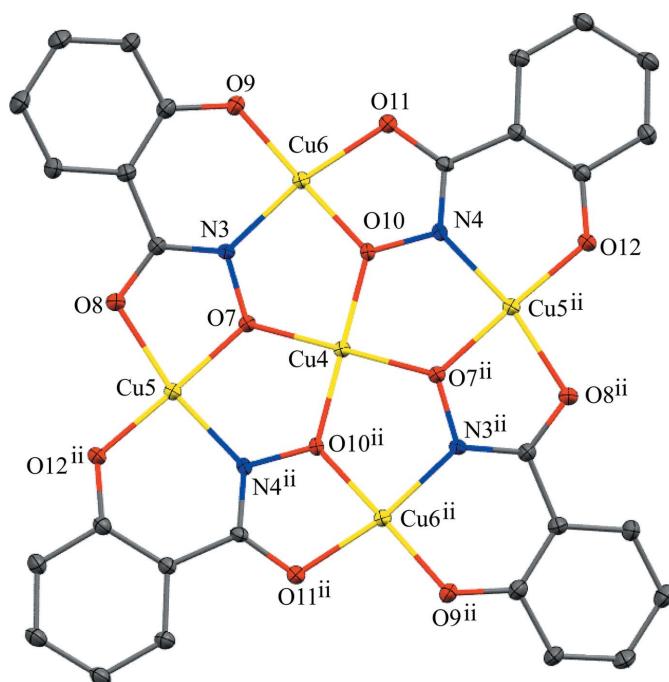

Figure 2

The single-crystal X-ray structure of $[\text{Cu}[12\text{-MC}_{\text{Cu}(\text{II})\text{N}(shi)}\text{-}4]]^{2-}$ associated with Cu4 with displacement ellipsoids at the 50% probability level [symmetry code: (ii) $1 - x, -y, 1 - z$]. For clarity, only non-carbon atoms have been labeled, and the MC associated with Cu1, the Mn^{II} counter-cation, the lattice DMF molecule, H atoms, and disorder have been omitted. See Fig. 1 for additional display details.

Table 2

Continuous shape measurement (CShM) values (*SHAPE 2.1*; Llunell *et al.*, 2013) for the four-coordinate copper(II) ions.

	Square	Tetrahedron	Seesaw	Vacant trigonal bipyramidal
Cu1	0.025	33.350	19.048	34.881
Cu2	1.870	22.459	11.479	23.026
Cu3	0.404	30.267	16.579	30.405
Cu4	0.027	33.352	19.058	34.887
Cu5	0.435	30.734	16.919	30.682
Cu6	0.606	28.098	15.366	28.580

Table 3

Continuous shape measurement (CShM) values (*SHAPE 2.1*; Llunell *et al.*, 2013) for the six-coordinate manganese(II) ion.

	Hexagon	Pentagonal pyramid	Octahedron	Trigonal prism	Johnson pentagonal pyramid
Mn1	32.455	27.045	0.240	14.096	30.823

(Table 2), which is typical for a d^9 electron configuration (Llunell *et al.*, 2013; Pinsky & Avnir, 1998; Casanova *et al.*, 2004; Cirera *et al.*, 2005). The coordination environment of the central Cu^{II} ions (Cu1 and Cu4) are composed of four oxime oxygens from four different shi³⁻ ligands. The coordination environments of the ring Cu^{II} ions (Cu2, Cu3, Cu5, and Cu6) consist of *trans* five- and six-membered chelate rings: each five-membered chelate ring is formed by the carbonyl oxygen atom and the oxime oxygen atom of a shi³⁻ ligand, and each six-membered chelate ring is formed by the phenolate oxygen atom and oxime nitrogen atom of a different shi³⁻ ligand.

The use of the four trianionic shi³⁻ ligands and five divalent Cu^{II} ions yields an MC with overall charge of 2-, $\{Cu[12-MC_{Cu(II)N(shi)-4}]_2\}^{2-}$. This charge is balanced by the presence of a manganese cation in the lattice: *cis*-[Mn(H₂O)₂(DMF)₄]²⁺. The manganese ion is assigned an oxidation state of 2+ based on the average bond length of 2.171 Å, a BVS value of 2.01 valence units (v.u.), and overall charge-balance considerations (Table 1). A SHAPE analysis confirms the octahedral geometry of the cation (Table 3). The coordination environment of the Mn^{II} ion consists of four DMF molecules and two water molecules in a *cis* configuration. Lastly, a DMF molecule is located in the lattice.

3. Supramolecular features

No strong directional intermolecular interactions are observed between the $\{Cu[12-MC_{Cu(II)N(shi)-4}]_2\}^{2-}$ anions, but a number of hydrogen bonds exist between the MCs and the counter-cation *cis*-[Mn(H₂O)₂(DMF)₄]²⁺ and between the counter-cation and the lattice DMF molecule (Table 4, Fig. 3). The water molecule associated with O18 of the Mn^{II} cation forms hydrogen bonds to both MC anions. The hydrogen bonds are to phenolate oxygen atoms (O18-H18C···O3 and O18-H18D···O9) of the neighboring MCs. The water molecule associated with O19 of the Mn^{II} cation forms hydrogen bonds to a carbonyl oxygen atom of the MC associated with Cu1

Table 4

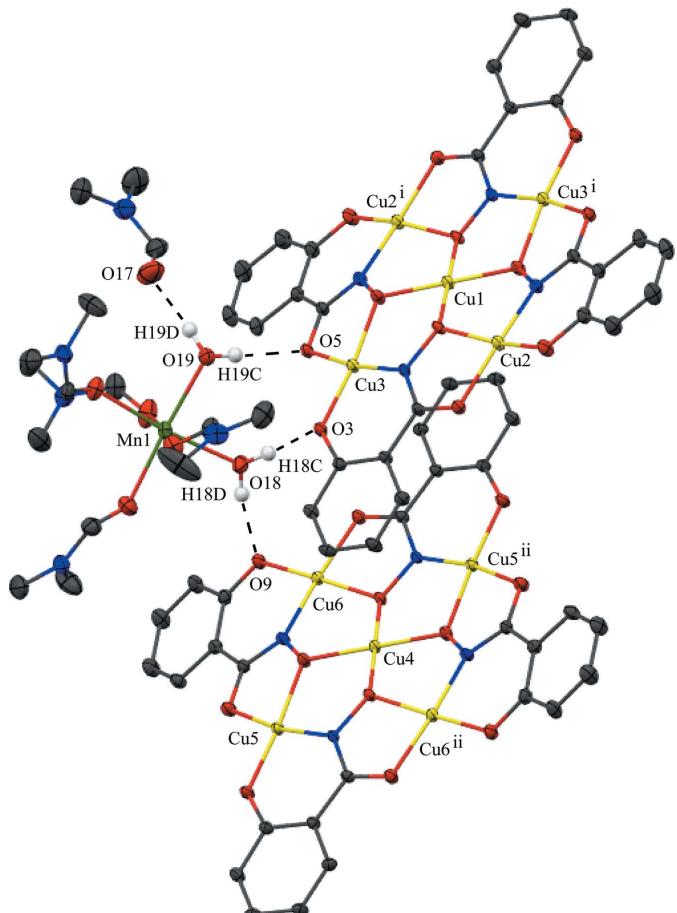

Hydrogen-bond geometry (Å, °).

D-H···A	D-H	H···A	D···A	D-H···A
O18-H18C···O3	0.83 (2)	2.07 (3)	2.847 (3)	156 (5)
O18-H18D···O9	0.84 (2)	1.95 (2)	2.778 (3)	169 (5)
O19-H19C···O5	0.83 (2)	1.93 (2)	2.746 (3)	167 (5)
O19-H19D···O17	0.84 (2)	1.88 (2)	2.713 (4)	175 (5)

(O19-H19C···O5) and to the carbonyl oxygen atom of the lattice DMF molecule (O19-H19D···O17). These hydrogen-bonding interactions, in addition to pure van der Waals forces, contribute to the overall packing of the molecules.

4. Database survey

As stated above, the Cambridge Structural Database (CSD version 5.41, update March 2020; Groom *et al.*, 2016) lists 35 different pentacopper(II) 12-metallacrown-4 complexes with four ring Cu^{II} ions and one central Cu^{II} ion. A variety of different ligands are used to generate the MCs, but only four structures use the ligand salicylhydroximate to build the

**Figure 3**

The intermolecular hydrogen bonds present between neighboring molecules of *cis*-[Mn(H₂O)₂(DMF)₄] $\{Cu[12-MC_{Cu(II)N(shi)-4}]_2\}\cdot$ DMF with displacement ellipsoids at the 50% probability level [symmetry codes: (i) $2 - x, -y, 1 - z$ and (ii) $1 - x, -y, 1 - z$]. For clarity only the H atoms (white) involved in the hydrogen bonding are displayed. See Fig. 1 for additional display details.

$\{\text{Cu}^{\text{II}}[\text{12-MC}_{\text{Cu}(\text{II})}\text{-4}]\}^{2-}$ framework. The counter-cations in the four other structures are tetramethylammonium (YELTOY; Gibney *et al.*, 1994), $[\text{Na(15-crown-5)}]^+$ (YELTIS; Gibney *et al.*, 1994), tetraethylammonium (UNOTUN; Herring *et al.*, 2011), and triethylammonium (COLVAC; Happ & Rentschler, 2014). For the structures with tetramethylammonium, tetraethylammonium, triethylammonium, and *cis*- $[\text{Mn}(\text{H}_2\text{O})_2(\text{DMF})_4]^{2+}$, the cations are located in the lattice, and the $[\text{Cu}[\text{12-MC}_{\text{Cu}(\text{II})}\text{N(shi)}\text{-4}]\}^{2-}$ anions can be considered nearly planar with a ‘molecular disk’ configuration or slightly to significantly non-planar with a ‘sofa’ configuration. As originally described by Pecoraro and coworkers (Gibney *et al.*, 1994), in the molecular disk configuration the benzene rings of the shi³⁻ ligands lie approximately in the same plane, and in the sofa configuration two of the benzene rings are tilted upwards relative to the MC central cavity and the two opposite benzene rings are tilted downwards. Lastly, for the structure with $[\text{Na(15-crown-5)}]^+$, the two cations are bound to the phenolate and carbonyl oxygen atoms of the $[\text{Cu}[\text{12-MC}_{\text{Cu}(\text{II})}\text{N(shi)}\text{-4}]\}^{2-}$ anion. This causes the MC to become domed with the benzene rings pointing downwards relative to the MC central cavity and the $[\text{Na(15-crown-5)}]^+$ cations bonded to the convex side of the MC.

5. Synthesis and crystallization

Manganese(II) chloride tetrahydrate (Certified ACS) was purchased from Fisher Scientific. Copper(II) chloride dihydrate was purchased from J. T. Baker Chemical Company. Salicylhydroxamic acid (99%) was purchased from Alfa Aesar. Triethanolamine (98%) was purchased from Sigma-Aldrich. *N,N*-Dimethylformamide (DMF, Certified ACS) was purchased from BDH Chemicals. All reagents were used as received without further purification.

Salicylhydroxamic acid (H_3shi ; 0.1541 g, 1 mmol) and copper(II) chloride dihydrate (0.1705 g, 1 mmol) were dissolved in 10 mL of DMF resulting in a green–brown solution. Triethanolamine (0.3764 g, 2.5 mmol) was then added to the $\text{CuCl}_2/\text{H}_3\text{shi}$ solution, resulting in a dark-green color. Separately, manganese(II) chloride tetrahydrate (0.7891 g, 4 mmol) was dissolved in 20 mL of DMF, resulting in a clear and colorless solution. The MnCl_2 solution was then added to the $\text{CuCl}_2/\text{H}_3\text{shi}$ /triethanolamine solution and no color change was observed. The solution was stirred overnight and then gravity filtered the next day. A dark-green precipitate was recovered and discarded. The filtrate was a dark-green color. The solution was left for slow evaporation at room temperature, and after 26 days dark-green plate-shaped crystals were collected for X-ray analysis. The remaining crystals were collected, washed with cold DMF, and dried. The percentage yield of the reaction was 57% (0.1576 g, 0.1147 mmol) based on copper(II) chloride dihydrate.

6. Refinement

Two crystallographically independent metallacrown anions are present in the structure. Both are located on crystal-

Computer programs: *APEX3* and *SAINT* (Bruker, 2016), *SHELXS97* (Sheldrick, 2008), *SHELXL2018/1* (Sheldrick, 2015), *SHELXE Rev859* (Hübschle *et al.*, 2011), *Mercury* (Macrae *et al.*, 2020) and *publCIF* (Westrip, 2010).

lographic inversion centers with the central of the five copper atoms situated on the inversion center. Both anions exhibit minor main molecule disorder by an approximate (non-crystallographic) 180° rotation. A *cis*- $[\text{Mn}(\text{H}_2\text{O})_2(\text{DMF})_4]^{2+}$ cation and a solvate DMF molecule are located in the lattice and are not disordered. The major and minor disordered moieties of both anions were each restrained to have similar geometries (*SHELXL SAME* commands). U^{ij} components of ADPs for disordered atoms closer to each other than 2.0 Å were restrained to be similar. Subject to these conditions the occupancy ratio refined to 0.9010 (9) to 0.0990 (9) for the anion associated with Cu1 and 0.9497 (8) to 0.0503 (8) for the anion associated with Cu4. Water hydrogen-atom positions were refined and O–H distances restrained to 0.84 (2) Å. Additional crystallographic data and experimental parameters are provided in Table 5 and the CIF of the compound.

Hydrogen atoms attached to carbon atoms as well as hydroxyl hydrogen atoms were positioned geometrically and constrained to ride on their parent atoms. Carbon–hydrogen bond distances were constrained to 0.95 Å for aromatic and aldehyde C–H moieties, and to 0.98 Å for CH₃ moieties. Oxygen–hydrogen distances of alcohols were constrained to 0.84 Å and were allowed to rotate but not to tip to best fit the experimental electron density. $U_{\text{iso}}(\text{H})$ values were set to

$kU_{\text{eq}}(\text{C}, \text{O})$ with $k = 1.5$ for CH_3 and OH , and 1.2 for $\text{C} - \text{H}$ units.

Data collection: *APEX3* (Bruker, 2016); cell refinement: *SAINT* (Bruker, 2016); data reduction: *SAINT* (Bruker, 2016); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL2018/1* (Sheldrick, 2015), *SHELXE Rev859* (Hübschle *et al.*, 2011); molecular graphics: *Mercury* (Macrae *et al.*, 2020); software used to prepare material for publication: *publCIF* (Westrip, 2010).

cis-Diaquatetrakis(dimethylformamide- κO)manganese(II) tetrakis(μ_3 -N,2-dioxidobenzene-1-carboximidate)pentacopper(II) dimethylformamide monosolvate

Crystal data

[Mn(C ₃ H ₇ NO) ₄ (H ₂ O) ₂] [Cu ₅ (C ₇ H ₄ NO ₃) ₄]·C ₃ H ₇ NO	F(000) = 2792
M _r = 1374.60	D _x = 1.739 Mg m ⁻³
Monoclinic, P2 ₁ /n	Mo K α radiation, λ = 0.71073 Å
<i>a</i> = 19.0669 (9) Å	Cell parameters from 9700 reflections
<i>b</i> = 14.2943 (6) Å	θ = 2.8–38.6°
<i>c</i> = 19.3450 (8) Å	μ = 2.30 mm ⁻¹
β = 95.1476 (18)°	T = 100 K
<i>V</i> = 5251.2 (4) Å ³	Block, dark green
Z = 4	0.45 × 0.41 × 0.25 mm

Data collection

Bruker AXS D8 Quest CMOS diffractometer	87027 measured reflections
Radiation source: sealed tube X-ray source	28700 independent reflections
Triumph curved graphite crystal monochromator	18767 reflections with $I > 2\sigma(I)$
ω and phi scans	$R_{\text{int}} = 0.043$
Absorption correction: multi-scan (<i>SADABS2016/2</i> ; Krause <i>et al.</i> , 2015)	$\theta_{\text{max}} = 38.7^\circ$, $\theta_{\text{min}} = 2.7^\circ$
$T_{\text{min}} = 0.582$, $T_{\text{max}} = 0.748$	$h = -33 \rightarrow 33$
	$k = -25 \rightarrow 25$
	$l = -33 \rightarrow 31$

*Refinement*Refinement on F^2

Least-squares matrix: full

 $R[F^2 > 2\sigma(F^2)] = 0.065$ $wR(F^2) = 0.143$ $S = 1.07$

28700 reflections

1153 parameters

1810 restraints

Primary atom site location: structure-invariant
direct methodsSecondary atom site location: difference Fourier
map

Hydrogen site location: mixed

H atoms treated by a mixture of independent
and constrained refinement $w = 1/[\sigma^2(F_o^2) + (0.0001P)^2 + 29.7569P]$
where $P = (F_o^2 + 2F_c^2)/3$ $(\Delta/\sigma)_{\text{max}} = 0.001$ $\Delta\rho_{\text{max}} = 2.44 \text{ e } \text{\AA}^{-3}$ $\Delta\rho_{\text{min}} = -2.18 \text{ e } \text{\AA}^{-3}$ *Special details*

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Two crystallographically independent metallacrown anions are present in the structure. Both are located on crystallographic inversion centers, with the central of the five copper atoms situated on the inversion center. Both anions exhibit minor main molecule disorder, by an approximate (non-crystallographic) 180 degree rotation. Not disordered are the Mn(DMF)4(H₂O)₂ cation and a solvate DMF molecule.

The major and minor disordered moieties of both anions were each restrained to have similar geometries. Uij components of ADPs for disordered atoms closer to each other than 1.7 Angstrom were restrained to be similar. Subject to these conditions the occupancy ratio refined to 0.9010 (9) to 0.0990 (9) for the first molecule and 0.9497 (8) to 0.0503 (8) for the second.

Water H atom positions were refined and O-H distances restrained to 0.84 (2) Angstrom.

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters (\AA^2)
