Synthesis, crystal structures, and Hirshfeld analysis of three hexahydroquinoline derivatives

Scott A. Steiger,^a‡ Chun Li,^b Allen G. Oliver^c and Nicholas R. Natale^{a*}^aDepartment of Biomedical and Pharmaceutical Sciences, University of Montana, Missoula, MT 59812, USA,^bDepartment of Chemistry, Ithaca College, 953 Danby Road, Ithaca, NY 14850, USA, and ^cDepartment of Chemistry and Biochemistry, University of Notre Dame, Notre Dame, IN 46556, USA. *Correspondence e-mail: Nicholas.Natale@mso.umt.edu

Three hexahydroquinoline derivatives were synthesized and crystallized in an effort to study the structure–activity relationships of these calcium-channel antagonists. The derivatives are ethyl 4-(2-methoxyphenyl)-2,7,7-trimethyl-5-oxo-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate, $C_{22}H_{27}NO_4$, (I), ethyl 4-(4-methoxyphenyl)-2,7,7-trimethyl-5-oxo-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate, $C_{22}H_{27}NO_4$, (II), and ethyl 4-(3,4-dihydroxyphenyl)-2,7,7-trimethyl-5-oxo-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate, $C_{21}H_{24}NO_5$, (III). In these hexahydroquinoline derivatives, common structural features such as a flat-boat conformation of the 1,4-dihydropyridine (1,4-DHP) ring, an envelope conformation of the fused cyclohexanone ring, and a substituted phenyl group at the pseudo-axial position are retained. Hydrogen bonds are the main contributors to the packing of the molecules in these crystals.

1. Chemical context

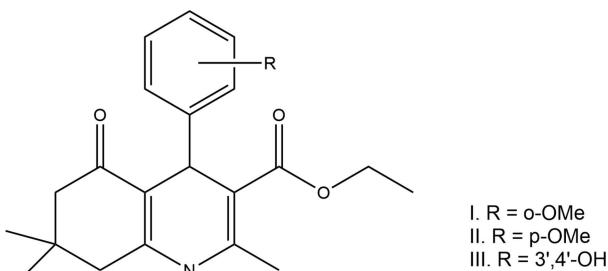

4-Aryl-1,4-dihydropyridines (DHPs) that bind the L-type voltage-gated calcium channels (VGCC) have been applied in general medical practice for over three decades (Zamponi, 2016). Many modifications on 1,4-DHP have been performed to obtain active compounds such as calcium-channel agonists or antagonists (Martín *et al.*, 1995; Rose, 1990; Rose & Dräger, 1992; Trippier *et al.*, 2013). One such modification is fusing a cyclohexanone ring to form hexahydroquinoline (HHQ), in which the orientation of the carbonyl group of the ester substituent at the 5-position in the 1,4-DHP ring has been fixed. This class of compounds has been shown to have calcium-channel antagonistic activity (Aygün Cevher *et al.*, 2019), inhibit the multidrug-resistance transporter (MDR) (Shahraki *et al.*, 2017, 2020), as well as possessing anti-inflammatory and stem-cell differentiation properties, and have been implicated in slowing neurodegenerative disorders (Trippier *et al.*, 2013). Recently, specific substitutions of the cyclohexenone ring were found to have distinct selectivity profiles to different calcium channel subtypes (Schaller *et al.*, 2018). Another report also showed that the 4-aryl-hexahydroquinolines, especially the ones containing a methoxy moiety, exhibit good antioxidant property as radical scavengers (Yang *et al.*, 2011). In a continuation of our study on the structure–activity relationship of this class of 4-aryl-hexahydroquinolines (Steiger *et al.*, 2014, 2018, 2020), and to understand stereoelectronic effects, which define selectivity, as well as to explore the scope and limitations of our synthetic methodologies (Steiger *et al.*, 2016), we report herein the

crystal structures of three 4-aryl-hexahydroquinoline derivatives.

2. Structural commentary

The asymmetric unit of the title compound I contains one independent molecule, which crystallizes in the triclinic $P\bar{1}$ space group (Fig. 1). Compounds II and III both crystallize in the monoclinic space group $P2_1/n$. The asymmetric unit of compound II contains two independent molecules, A and B (Fig. 2), while compound III has only one independent molecule in the asymmetric unit (Fig. 3). Similar to the other 4-aryl-hexahydroquinoline derivatives that we have reported (Steiger, *et al.*, 2014; 2018; 2020), compounds I, II, and III all share the common structural features such as a flattened boat conformation on the 1,4-DHP ring, envelope conformation of the cyclohexanone ring, and the pseudo-axial position of the 4-aryl group.

The shallow-boat confirmation of the 1,4-DHP ring is one of the factors that leads to higher calcium-channel activity (Linden *et al.*, 2004). The shallowness of the boat conformation in these three compounds are indicated by the marginal displacements of atom N1 and C4 from the mean plane (the base of the boat) defined by the two double bonds ($C_2=C_3$

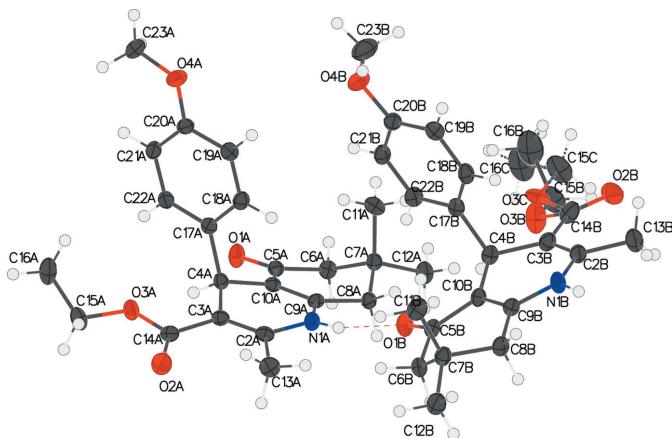

Figure 2
The asymmetric unit of compound II showing the atom-labeling scheme. Displacement ellipsoids are drawn at the 50% probability level. The intermolecular hydrogen bond between N1A—H1A and O1B is shown as a dashed line.

and $C_9=C_{10}$). The distances between N1 and the mean plane formed by $C_2/C_3/C_9/C_{10}$ are 0.159 (3), 0.110 (2), 0.110 (3), and 0.181 (2) Å for compounds I, IIA, IIB, and III, respectively. The corresponding distances between C4 and the same mean plane are 0.341 (3), 0.295 (3), 0.253 (3), and 0.399 (2) Å for compounds I, IIA, IIB, and III, respectively.

The pseudo-axial position of the C4-aryl group to the 1,4-DHP ring is another key factor that is essential for pharmacological activity (Langs *et al.*, 1987). In the title compounds, the substituted phenyl rings are almost orthogonal to the base of the 1,4-DHP ring, with the mean plane normal to normal angles being 89.09 (7), 92.52 (6), 93.52 (6), and 90.59 (5)° for compounds I, IIA, IIB, and III, respectively (see Table 1 for calculated parameters). It is noteworthy that the *para*-methoxy group on the phenyl ring is flexible and can be either *anti*- or *syn*-periplanar to the H atom on C4, *i.e.* pointing either to (IIA) or away from (IIB) the 1,4-DHP ring.

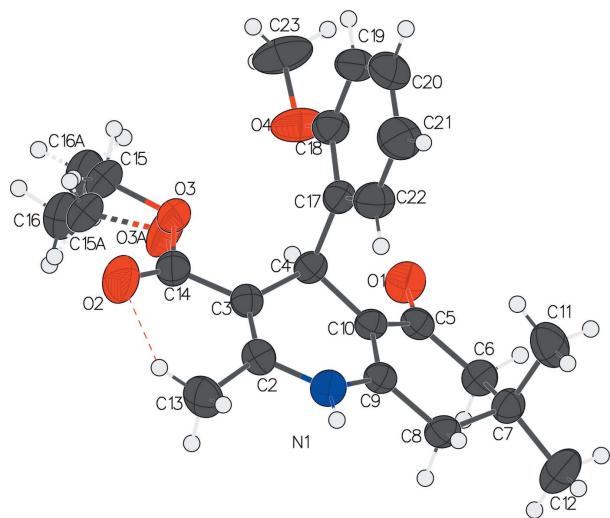

Figure 1

Table 1Calculated parameters (\AA , $^\circ$) related to the 1,4-DHP ring.

Compound	1,4-DHP mean plane (C2/C3/C10/C9) r.m.s.d	N to ring mean plane distance	C to ring mean plane distance	Phenyl ring to 1,4-DHP mean planes normal-to-normal angle	N1—C4—C17—C18 torsion angle
I	0.015	0.159 (3)	0.341 (3)	89.09 (7)	173.28 (16)
IIA	0.005	0.110 (2)	0.295 (3)	92.52 (6)	1.16 (18)
IIB	0.005	0.110 (3)	0.253 (3)	93.52 (6)	13.41 (14)
III	0.001	0.181 (2)	0.399 (2)	90.59 (5)	18.38 (15)

Table 2Parameters (\AA , $^\circ$) related to the envelope conformation on the cyclohexanone ring.

Compound	Mean plane (C5/C6/C8—C10) r.m.s.d	C7 to mean plane distance	C11—C7—C4—C17 torsion angle	Ring puckering parameters		
				Q	θ	φ
I	0.025	0.636 (3)	2.53 (18)	0.458 (2)	60.7 (3)	117.2 (3)
IIA	0.015	0.644 (2)	7.96 (14)	0.4616 (18)	56.1 (2)	115.7 (3)
IIB	0.019	0.645 (3)	13.85 (14)	0.4638 (19)	121.2 (2)	303.0 (3)
III	0.028	0.6408 (19)	0.8 (1)	0.4623 (15)	56.53 (19)	111.1 (2)

In all three compounds, the cyclohexanone rings adopt the envelope conformation, which can be quantified using Cremer & Pople's ring-puckering parameters. Ideally, the envelope conformation would have $\theta = 54.7^\circ$ (or $\theta = 125.3^\circ$ in the case of an absolute configuration change) and $\varphi = n \times 60^\circ$. The θ and φ values of the title compounds are very close to the ideal angles with deviations less than 10° and are listed in Table 2.

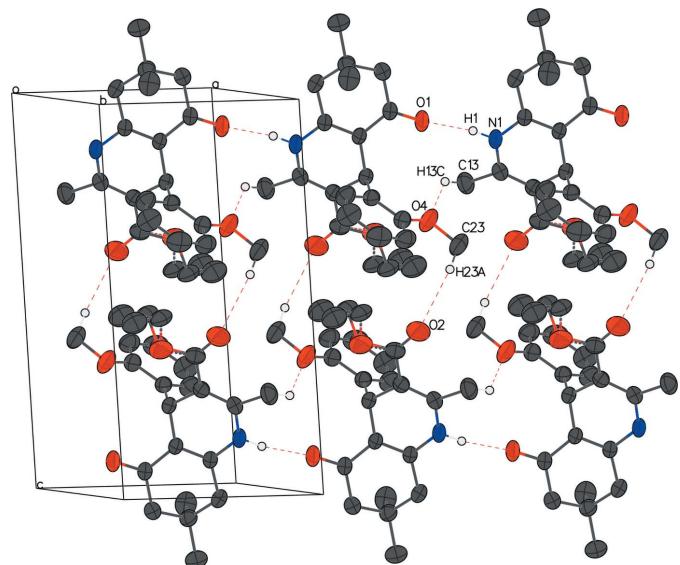

Although the carbonyl on the ester group is conjugated to the adjacent endocyclic double bond and is co-planar to the 1,4-DHP mean plane, the whole ester group is flexible. The C=O bond can be either *cis* (I, IIA and IIB) or *trans* (III) to the adjacent double bond, and the extended or curled orientations of the ethyl group are observed in these crystal structures. The disordered ethyl groups in compound I and compound II also indicate the flexibility of the ester group.

3. Supramolecular features

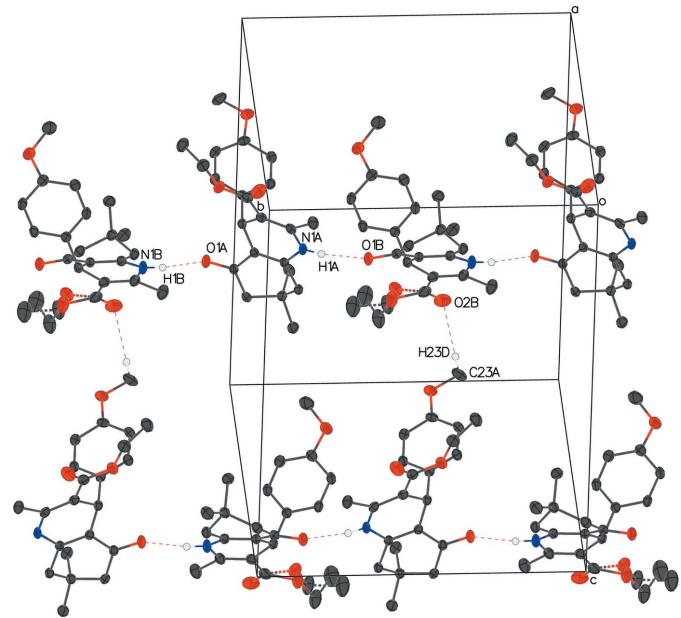

In compound I, hydrogen bonds between N1—H1 and O1 form a chain perpendicular to the (100) plane. Short contact C23—H23A···O2 links alternate enantiomers to form a pair perpendicular to the (001) plane (Table 3, Fig. 4).

In compound II, hydrogen bonds N1A—H1A···O1B and N1B—H1B···O1A link the two independent molecules *A* and *B* to form a chain perpendicular to the (010) plane. Close contacts C23B—H23B···O2A and C23A—H23D···O2B link the two independent molecules zigzagged along the *c*-axis direction (Table 4, Fig. 5).

In compound III, a chain is formed by hydrogen bonds N1—H1···O1ⁱ and O4—H4···O2ⁱ between alternating

Contacts with distances approximately equal to the sum of the van der Waals radii are colored white. A $\sigma\cdots\pi$ interaction between C15—H15 and phenyl ring is shown as green dashed lines. Hydrogen bond C23—H23A \cdots O2 is shown as red dashed lines.

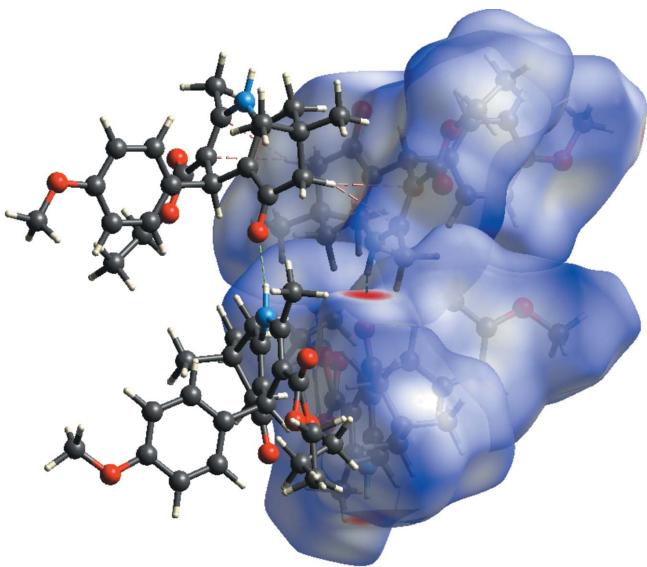

chain to form a sheet of molecules parallel to the (010) plane (Table 5, Fig. 6).

4. Hirshfeld surface analysis

Hirshfeld surface analysis (Spackman & Jayatilaka, 2009) was performed, and the associated two-dimensional fingerprint plots (McKinnon *et al.*, 2007) were generated to quantify the intermolecular interactions using *Crystal Explorer* 21.5 (Spackman *et al.*, 2021). The Hirshfeld surface of the title compound **I** is mapped over d_{norm} in a fixed color scale of -0.5596 (red) to 1.4022 (blue) arbitrary units (Fig. 7). The N—H \cdots O hydrogen bond is apparent as red spots on the surface. A $\sigma\cdots\pi$ interaction between the ester ethyl group and the phenyl ring is noticeable. The delineated two-dimensional

**Figure 8**

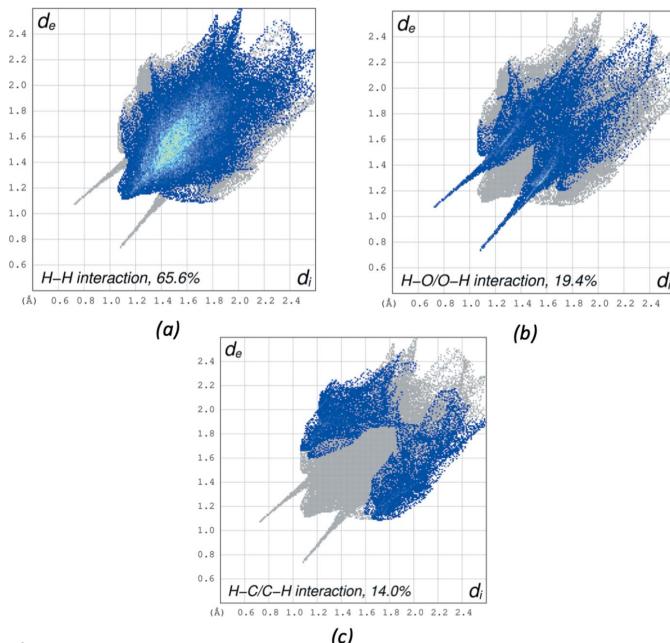

The two-dimensional fingerprint plots for **I** delineated into (a) H \cdots H contacts, (b) H \cdots O/O \cdots H contacts, (c) H \cdots C/C \cdots H contacts. Other contact contributions less than 1% are omitted.

**Figure 9**

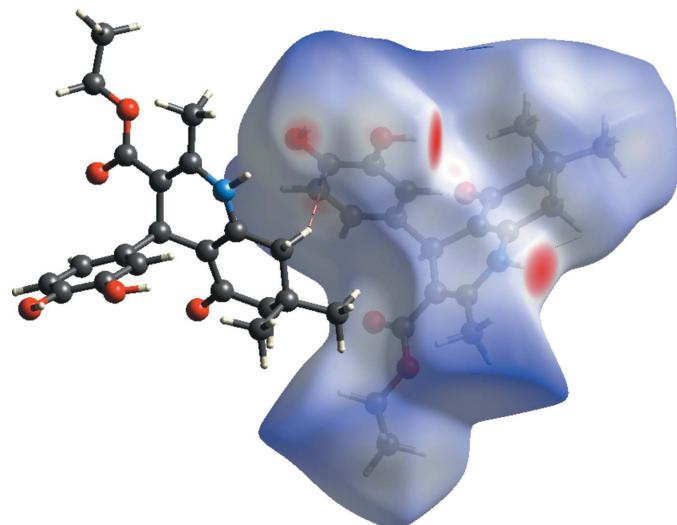

Hirshfeld surface of II mapped over d_{norm} . Short and long contacts are indicated as red and blue regions, respectively. Contacts with distances approximately equal to the sum of the van der Waals radii are colored white. A $\sigma\cdots\pi$ interaction (C6A—H6AB to double bond C2A=C3A) is shown as red dashed lines. Hydrogen bonds between N—H and O are shown as green dashed lines.

fingerprint plots (Fig. 8) show that the contributions to the overall Hirshfeld surface area arise from H \cdots H contacts (65.3%), O \cdots H/H \cdots O contacts (17.7%), and C \cdots H/H \cdots C interactions (16.4%).

For compound II, the Hirshfeld surface analysis was performed with two independent molecules, in a fixed color scale of -0.6119 (red) to 1.7055 (blue) arbitrary units. In addition to hydrogen bonds, $\sigma\cdots\pi$ interactions are also identi-

**Figure 10**

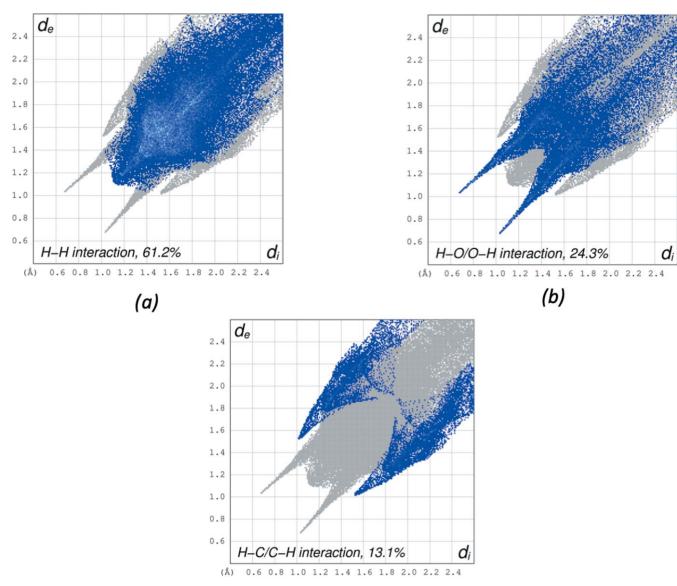

The two-dimensional fingerprint plots for II delineated into (a) H \cdots H contacts, (b) H \cdots O/O \cdots H contacts, (c) H \cdots C/C \cdots H contacts. Other contact contributions of less than 1% are omitted.

**Figure 11**

Hirshfeld surface of III mapped over d_{norm} . Short and long contacts are indicated as red and blue regions, respectively. Contacts with distances approximately equal to the sum of the van der Waals radii are colored white. The close contact between H8A and C20 is shown as a dashed line.

fiable between C6A—H6AB and double bond C2A=C3A (Fig. 9). The delineated two-dimensional fingerprint plots shown in Fig. 10 indicate that H \cdots H contacts (65.6%) make the main contribution to the overall Hirshfeld surface area. The O \cdots H/H \cdots O contacts and C \cdots H/H \cdots C interactions contribute 19.4% and 14.0% of the Hirshfeld surface, respectively.

The Hirshfeld surface of the title compound III is mapped over d_{norm} in a fixed color scale of -0.7001 (red) to 3.4800 (blue) arbitrary units (Fig. 11). Besides the obvious short contacts from hydrogen bonds, a short contact of 2.6137 (14) \AA between H8A and C20 is also observed, indi-

**Figure 12**

The two-dimensional fingerprint plots for III delineated into (a) H \cdots H contacts, (b) H \cdots O/O \cdots H contacts, (c) H \cdots C/C \cdots H contacts. Other contact contributions of less than 1% are omitted.

cating a $\sigma\text{-}\pi$ -interaction between C8—H8A and ring C17—C22. The delineated two-dimensional fingerprint plots shown in Fig. 12 indicate that two main contributions to the overall Hirshfeld surface area arise from H· · · H contacts (61.2%) and O· · · H/H· · · O contacts (24.3%). C· · · H/H· · · C interactions contribute 13.1% of the Hirshfeld surface.

5. Database survey

A search for 4-phenyl-5-oxo-hexahydroquinoline-3-carboxylate in the Cambridge Structural Database (CSD version 5.43, November 2021 update; Groom *et al.*, 2016) resulted in 53 hits, of which a *meta*-methoxyl-substituted 4-phenyl-5-oxo-hexahydroquinoline-3-carboxylate (refcode TANVUC; Li, 2017) should be mentioned. Similar to the title compounds I and II A, the *meta*-methoxyl group in TANVUC is *exo* to the 1,4-DHP ring and carbonyl group on the ester is in a *cis* orientation to the endocyclic double bond. All of the resulting hits display common structural features, such as the flat-boat conformation of the 1,4-DHP ring, the envelope conformation of the fused cyclohexanone ring, and the substituted aryl ring at the pseudo-axial position to the 1,4-DHP ring.

6. Synthesis and crystallization

An oven-dried 100 ml round-bottom flask equipped with a magnetic stir bar was charged with 10 mmol of dimedone, 10 mmol of ethyl acetoacetate and 5 mol % of ytterbium(III) trifluoromethanesulfonate. The mixture was then taken up in 30 ml of absolute ethanol, capped and put under an inert atmosphere of argon, after which the solution was allowed to stir at room temperature for 20 min. the appropriate corresponding benzaldehyde (10 mmol) and 10 mmol of ammonium acetate were added to the stirring solution, the solution was allowed to stir at room temperature for 48 h. Reaction progress was monitored *via* TLC. Once the reaction was complete, excess solvent was removed *via* rotary evaporation. The solution was then purified *via* silica column chromatography. The products were crystallized from hexane and ethyl acetate (1:4 *v/v*) as white-to-yellow crystalline solids. Compounds I and III were recrystallized from a minimum of warm methanol, to which hexane was added dropwise to a faint opalescence, and slow evaporation produced diffraction-quality crystals.

Compound I: m.p. 520.5 K. ^1H NMR: (CDCl_3) δ ppm 7.28 (*dd*, 1H, J = 7.33 and 1.83 Hz); 7.07 (*ddd*, 1H, J = 8.24, 7.33 and 1.83 Hz); 6.80 (*d*, 1H, J = 7.33 Hz); 6.78 (*d*, 1H, J = 8.24 Hz); 5.69 (*s, br*, 1H); 5.24 (*s*, 1H); 4.00 (*m*, 2H); 3.78 (*s*, 3H); 2.31 (*d*, 1H, J = 23.81 Hz); 2.30 (*s*, 3H); 2.13 (*q*, 2H, J = 16.49 Hz); 2.11 (*d*, 1H, J = 32.84 Hz); 1.17 (*t*, 3H, J = 7.2 Hz); 1.06 (*s*, 3H); 0.92 (*s*, 3H). ^{13}C NMR: (CDCl_3) δ ppm 195.32; 167.98; 157.61; 148.12; 142.99; 134.51; 131.39; 127.34; 120.06; 111.26; 110.90; 105.26; 59.70; 55.46; 50.80; 41.47; 33.58; 32.69; 29.59; 26.99; 19.53; 14.23. HPLC-MS: calculated for $[\text{C}_{21}\text{H}_{25}\text{NO}_5+\text{H}]^+$ 372.43, observed m/z 372.1657 ($[M+1]^+$, 100% rel. intensity).

7. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 6. Carbon-bound hydrogen atoms on all three compounds were fixed geometrically and treated as riding with C—H = 0.95–0.98 Å and refined with $U_{\text{iso}}(\text{H})$ = $1.2U_{\text{eq}}(\text{CH}, \text{CH}_2)$ or $1.5U_{\text{eq}}(\text{CH}_3)$. Hydrogen atoms attached to nitrogen and oxygen were found in difference-Fourier map and refined freely. Eight reflections (010, $0\bar{1}0$, $0\bar{1}\bar{1}$, 011, $0\bar{0}\bar{1}$, 001, 002, and $0\bar{0}\bar{2}$) in compound I and eight reflections (040, 020, 123, 723, 076, 031, 112, and 516) in compound III were omitted because of poor agreement between the observed and calculated intensities.

Data of compound I were acquired at room temperature due to the disintegration of the crystals at low temperatures. The sample measured was identified as two crystals, mis-oriented by 0.24° approximately about the [001] reciprocal-space axis. For the purposes of data collection and subsequent structure refinement, the structure was treated using facilities for handling twinning by non-merohedry, namely HKLF5 data in *SHELXL* (Sheldrick, 2015), yielding a ratio of 0.866 (2):0.134 (2) for the two crystals. In compound I, the ethyl group on the carboxylic ester is disordered and was modeled at 50% occupancy at each site. Atomic displacement equivalency restraints and bond-length restraints (Sheldrick, 2015) were applied to the carbon atoms and the single-bond oxygen atom of the disordered ester group.

The crystals of compound II were found to be pseudo-merohedric twins by a 180° rotation about the *c* axis. Application of the twin operation ($-1, 0, 0, 0, -1, 0, 0, 0, 1$) yielded a twin component ratio of 0.6938 (8):0.3062 (8). The ester group on molecule *B* is also disordered. Atomic displacement equivalency restraints were applied to the two carbons and the single bond oxygen on the ethyl group. Restraints were applied to bond lengths on the atoms of the ester as well.

Compound III was co-crystallized with hexanes. However, being a mixture of disordered hexane isomers, the refinement around the hexanes did not give satisfactory results. The

Computer programs: *APEX2* (Bruker, 2012), *SAINT* (Bruker, 2016), *SHELXS* (Sheldrick, 2008), *SHELXL2018/1* (Sheldrick, 2015), *OLEX2* (Dolomanov *et al.*, 2009).

OLEX2 SMTBX (Rees *et al.*, 2005) solvent-masking procedure was used to calculate and mask the solvent-accessible void. There are 192 electrons found in a volume of 464 Å³ in one void per unit cell. This is consistent with the presence of one C₆H₁₄ molecule per asymmetric unit, which accounts for 200 electrons per unit cell.

Acknowledgements

The authors thank the University of Montana for grant 325490. CL thanks all the faculty in the ACA Summer Course 2016, from whom CL has learned a lot in refining disordered and twinned structures. The authors also thank Eric Schultz for mass spectra, supported by the National Institute of General Medical Sciences of the National Institutes of Health under Award No. P30GM140963.

Funding information

Funding for this research was provided by: University of Montana (grant No. 325490 to Nicholas R. Natale); National Institutes of Health, National Institute of General Medical Sciences (grant No. P30GM140963 to Nicholas R. Natale).

Synthesis, crystal structures, and Hirshfeld analysis of three hexahydroquinoline derivatives

Scott A. Steiger, Chun Li, Allen G. Oliver and Nicholas R. Natale

Computing details

For all structures, data collection: *APEX2* (Bruker, 2012); cell refinement: *SAINT* (Bruker, 2016); data reduction: *SAINT* (Bruker, 2016); program(s) used to solve structure: *SHELXS* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL2018/1* (Sheldrick, 2015); molecular graphics: *OLEX2* (Dolomanov *et al.*, 2009); software used to prepare material for publication: *OLEX2* (Dolomanov *et al.*, 2009).

Ethyl 4-(2-methoxyphenyl)-2,7,7-trimethyl-5-oxo-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate (I)

Crystal data

$C_{22}H_{27}NO_4$	$Z = 2$
$M_r = 369.44$	$F(000) = 396$
Triclinic, $P\bar{1}$	$D_x = 1.253 \text{ Mg m}^{-3}$
$a = 7.2941 (2) \text{ \AA}$	$Mo K\alpha$ radiation, $\lambda = 0.71073 \text{ \AA}$
$b = 9.6773 (3) \text{ \AA}$	Cell parameters from 7681 reflections
$c = 14.4302 (4) \text{ \AA}$	$\theta = 2.5\text{--}22.8^\circ$
$\alpha = 82.1992 (17)^\circ$	$\mu = 0.09 \text{ mm}^{-1}$
$\beta = 88.3216 (16)^\circ$	$T = 300 \text{ K}$
$\gamma = 75.9397 (16)^\circ$	Prism, colourless
$V = 978.92 (5) \text{ \AA}^3$	$0.35 \times 0.19 \times 0.14 \text{ mm}$

Data collection

Bruker SMART BREEZE CCD	22410 reflections with $I > 2\sigma(I)$
diffractometer	$\theta_{\max} = 28.4^\circ, \theta_{\min} = 2.9^\circ$
Radiation source: 2 kW sealed X-ray tube	$h = -9 \rightarrow 9$
φ and ω scans	$k = -12 \rightarrow 12$
34490 measured reflections	$l = -19 \rightarrow 19$
34490 independent reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Hydrogen site location: mixed
$R[F^2 > 2\sigma(F^2)] = 0.055$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.145$	$w = 1/[\sigma^2(F_o^2) + (0.0533P)^2 + 0.1957P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.03$	$(\Delta/\sigma)_{\max} < 0.001$
34490 reflections	$\Delta\rho_{\max} = 0.25 \text{ e \AA}^{-3}$
285 parameters	$\Delta\rho_{\min} = -0.17 \text{ e \AA}^{-3}$
39 restraints	

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refined as a 2-component twin. Twin law (-1 0 0 0 -1 0 0.0123 -0.407 1) was applied and the structure was refined using HKLF5 data, yielding a ratio of 0.866 (2):0.134 (2) for the two twin components.

Ethyl 4-(4-methoxyphenyl)-2,7,7-trimethyl-5-oxo-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate (II)

Crystal data

$C_{22}H_{27}NO_4$
 $M_r = 369.44$
Monoclinic, $P2_1/n$
 $a = 15.3492 (15)$ Å
 $b = 14.0314 (14)$ Å
 $c = 18.3862 (18)$ Å
 $\beta = 90.0834 (17)$ °
 $V = 3959.8 (7)$ Å³
 $Z = 8$

$F(000) = 1584$
 $D_x = 1.239 \text{ Mg m}^{-3}$
Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Cell parameters from 9980 reflections
 $\theta = 2.3\text{--}26.4$ °
 $\mu = 0.09 \text{ mm}^{-1}$
 $T = 120$ K
Rod, colourless
 $0.35 \times 0.15 \times 0.14$ mm

Data collection

Bruker APEXII CCD
diffractometer
 φ and ω scans
66519 measured reflections
8085 independent reflections
7121 reflections with $I > 2\sigma(I)$

$R_{\text{int}} = 0.055$
 $\theta_{\text{max}} = 26.4$ °, $\theta_{\text{min}} = 1.3$ °
 $h = -19 \rightarrow 19$
 $k = -17 \rightarrow 17$
 $l = -22 \rightarrow 22$

Refinement

Refinement on F^2
Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.039$
 $wR(F^2) = 0.093$
 $S = 1.04$
8085 reflections
536 parameters
39 restraints

Primary atom site location: structure-invariant
direct methods
Hydrogen site location: mixed
H atoms treated by a mixture of independent
and constrained refinement
 $w = 1/[\sigma^2(F_o^2) + (0.0433P)^2 + 1.0284P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\text{max}} = 0.001$
 $\Delta\rho_{\text{max}} = 0.33 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\text{min}} = -0.30 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refined as a 2-component twin. Application of the twin law (-1, 0, 0, 0, -1, 0, 0, 0, 0, 1) yielded a twin domain ratio of 0.6938 (8):0.3062 (8).

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters (Å²)

 $l = -15 \rightarrow 15$

*Refinement*Refinement on F^2

Least-squares matrix: full

 $R[F^2 > 2\sigma(F^2)] = 0.045$ $wR(F^2) = 0.123$ $S = 1.04$

5517 reflections

260 parameters

0 restraints

Primary atom site location: structure-invariant direct methods

Hydrogen site location: mixed

H atoms treated by a mixture of independent and constrained refinement

$$w = 1/[\sigma^2(F_o^2) + (0.0628P)^2 + 0.7593P]$$

where $P = (F_o^2 + 2F_c^2)/3$

$$(\Delta/\sigma)_{\max} < 0.001$$

$$\Delta\rho_{\max} = 0.41 \text{ e } \text{\AA}^{-3}$$

$$\Delta\rho_{\min} = -0.21 \text{ e } \text{\AA}^{-3}$$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Disordered hexanes molecules were identified in the final stage of refinement. The disorder of the hexanes was dealt with by application of the Olex2/smtbx_masks (Rees, *et al.*, 2005), which allows for the mathematical compensation of the electron contribution of disordered solvent contained in the voids to the calculated diffraction intensities.
