#### Abstract

${ }^{\text {a }}$ Department of Studies in Chemistry, University of Mysore, Manasagangotri, Mysuru-570 006, India, ${ }^{\mathbf{b}}$ Department of Science and Humanities, PES University, BSK III Stage, Bengaluru-560 085, India, ${ }^{\text {c }}$ Department of Chemistry, Amrita School of Engineering, Amrita Vishwa Vidyapeetham, Bengaluru-560 035, India, ${ }^{\text {d Honeychem Pharma Research Pvt. }}$ Ltd., Peenya Industrial Area, Bengaluru-560 058, India, and ${ }^{\mathbf{e}}$ Department of Chemistry, University of Kentucky, Lexington, KY, 40506-0055, USA. *Correspondence e-mail: ybb2706@gmail.com, yathirajan@hotmail.com

The synthesis and crystal structure of the title compound, $\mathrm{C}_{12} \mathrm{H}_{16} \mathrm{FNO}_{3} \mathrm{~S}$, which is related to the herbicide flufenacet, are presented. The dihedral angle between the amide group and the fluorinated benzene ring is $87.30(5)^{\circ}$ and the $\mathrm{N}-\mathrm{C}-$ $\mathrm{C}-\mathrm{S}$ torsion angle defining the orientation of the methylsulfonyl substituent relative to the amide group is $106.91(11)^{\circ}$. In the crystal, inversion-related molecules form dimers as a result of pairwise $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, which appear to be reinforced by short $\mathrm{O} \cdots \pi$ contacts $[\mathrm{O} \cdots C g=3.0643(11) \AA$ A. A Hirshfeld surface analysis was used to quantify the various types of intermolecular contacts, which are dominated by H atoms.

## 1. Chemical context

$N$-(Substituted phenyl)acetamides have a variety of biological activities. For example, substituted phenylacetamides and their use as protease inhibitors was reported by Kreutter et al. (2009) and a description of the syntheses and antioxidant studies of $N$-substituted benzyl/phenyl-2-[3,4-dimethyl-5,5-dioxidopyrazolo[4,3-c][1,2]benzothiazin-2(4H)-yl]acetamides was given by Ahmad et al. (2013). The syntheses and biological evaluation of $N^{4}$-substituted sulfonamide-acetamide derivatives as dihydrofolate reductase (DHFR) inhibitors was reported by Hussein et al. (2019) and the synthesis of $N$ (substituted phenyl)- N -(substituted)acetamide derivatives as potent analgesic agents was described by Verma et al. (2020). Lastly, the evaluation of new 2-hydroxy- N -(4-oxo-2-substituted phenyl-1,3-thiazolidin-3-yl)-2-phenylacetamide derivatives as potential antimycobacterial agents was reported by Güzel-Akdemir et al. (2020).

Figure 1
The molecular structure of $\mathbf{I}$ showing $50 \%$ displacement ellipsoids.

Flufenacet $\left(\mathrm{C}_{14} \mathrm{H}_{13} \mathrm{~F}_{4} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}\right)$, systematic name $N$-(4-fluorophenyl)- $N$-propan-2-yl-2-\{[5-(trifluoromethyl)-1,3,4-thiadiazol-2-yl]oxy\}acetamide, is an herbicide, xenobiotic and environmental contaminant (Rouchaud et al., 2001; Zimmerman et al., 2002). This paper reports the synthesis, crystal structure and a Hirshfeld surface analysis of the related title compound, $\mathrm{C}_{12} \mathrm{H}_{16} \mathrm{FNO}_{3} \mathrm{~S}$ (I) (Fig. 1).

## 2. Structural commentary

In the crystal structure of $\mathbf{I}$, the nitrogen atom of the amide group is close to planar, the sum of bond angles about N1 being $358.92(19)^{\circ}$, which places N1 0.0862 (14) $\AA$ from the plane passing through $\mathrm{C} 1, \mathrm{C} 4$, and C 7 . The amide group is also almost planar, having an r.m.s. deviation from the mean plane of N1, C1, O1, C2 of $0.0095 \AA$ [maximum $=0.0165$ (11) $\AA$ for C 1 ], and is almost perpendicular to the fluorobenzene ring (C7-C12), subtending a dihedral angle of $87.30(5)^{\circ}$. The overall conformation of the molecule is defined by the torsion angles $\quad \mathrm{C} 7-\mathrm{N} 1-\mathrm{C} 1-\mathrm{C} 2 \quad\left[14.68(17)^{\circ}\right], \quad \mathrm{N} 1-\mathrm{C} 1-\mathrm{C} 2-\mathrm{S} 1$ [106.91 (11) ${ }^{\circ}$, $\mathrm{C} 1-\mathrm{C} 2-\mathrm{S} 1-\mathrm{C} 3$ [74.53 (10) ${ }^{\circ}$ ] and by the orientation of the ${ }^{\mathrm{i}}$ propyl group, e.g., $\mathrm{C} 1-\mathrm{N} 1-\mathrm{C} 4-\mathrm{C} 6$ [139.85 (13) ${ }^{\circ}$ ]. Otherwise, all bond lengths and angles lie within the expected ranges.

## 3. Supramolecular features

There are no strong hydrogen bonds in the crystal structure of I (Fig. 2), but there are a number of weaker $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{F}$ interactions, which are quantified in Table 1. The most prominent supramolecular constructs are dimers in which inversion-related molecules are linked by $\mathrm{C} 2-$ $\mathrm{H} 2 A \cdots \mathrm{O}^{\mathrm{i}}$ and $\mathrm{C} 2^{\mathrm{i}}-\mathrm{H} 2 A^{\mathrm{i}} \cdots \mathrm{O} 3$ hydrogen bonds [symmetry code: (i) $1-x, 1-y, 1-z]$. These dimers also feature close contacts between the sulfone O3 atom and the inversionrelated benzene ring to give an $\mathrm{O} 3 \cdots \mathrm{Cg}(\mathrm{C} 7-\mathrm{C} 12)^{\mathrm{i}}$ distance of

Table 1
Weak hydrogen bonds and other short intermolecular contacts ( $\AA^{\circ},{ }^{\circ}$ ).

| $D-\mathrm{H} \cdots A$ | D-H | H $\cdots$ A | $D \cdots A$ | $D-\mathrm{H} \cdots A$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{C} 2-\mathrm{H} 2 A \cdots \mathrm{O} 3^{\text {i }}$ | 0.99 | 2.31 | 3.2025 (16) | 150 |
| $\mathrm{C} 3-\mathrm{H} 3 B \cdots \mathrm{O} 1^{\text {ii }}$ | 0.98 | 2.55 | 3.5196 (17) | 170 |
| $\mathrm{C} 5-\mathrm{H} 5 A \cdots \mathrm{~F} 1^{\text {iii }}$ | 0.98 | 2.50 | 3.4295 (18) | 158 |
| C11-H11 . O $1^{\text {iv }}$ | 0.95 | 2.39 | 3.1851 (16) | 141 |
| $\mathrm{C} 12-\mathrm{H} 12 \cdots \mathrm{O} 2^{\text {iv }}$ | 0.95 | 2.56 | 3.2955 (16) | 134 |
| $\mathrm{O} 3 \cdots \mathrm{Cg}(\mathrm{C} 7-\mathrm{C} 12)^{\mathrm{i}}$ |  |  | 3.0643 (11) |  |

Symmetry codes: (i) $-x+1,-y+1,-z+1$; (ii) $-x+1,-y,-z+1$; (iii) $x, y-1, z$; (iv) $x$, $-y+\frac{1}{2}, z+\frac{1}{2}$.
3.0643 (11) Å (e.g. Gung et al., 2008 and see also Section 4: Database survey). The other weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions involve inversion, translation, and $c$-glide related molecules (Table 1, Fig. 3a). A Hirshfeld surface analysis using CrystalExplorer (Spackman et al., 2021) shows that almost all atomatom contacts involve the hydrogen atoms (Fig. 3b-f).

## 4. Database survey

A search of the Cambridge Structural Database (CSD, v5.43 with updates through November 2022; Groom et al., 2016) for a molecular fragment consisting of $N$-phenylacetamide with 'any non-H group' attached at the nitrogen atom, the 4-posi-

Figure 2
A partial packing plot of $\mathbf{I}$, showing inversion dimers resulting from pairs of $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ weak hydrogen bonds, augmented by $\mathrm{O} \cdots C g$ (ring) contacts. Hydrogen atoms not involved in the hydrogen bonds are omitted.

(a) H-bond type close contacts

Figure 3
(a) The Hirshfeld surface of I expressed over $d_{\text {norm }}$, with $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{F}$ interactions drawn as dashed lines and as dark- and light-red regions on the Hirshfeld surface, respectively; (b) fingerprint plot of $\mathrm{H} \cdots \mathrm{H}$ contacts; $(c) \mathrm{H} \cdots \mathrm{O} / \mathrm{O} \cdots \mathrm{H}$ contacts; $(d) \mathrm{H} \cdots \mathrm{F} / \mathrm{F} \cdots \mathrm{H}$ contacts; $(e)$ $\mathrm{H} \cdots \mathrm{C} / \mathrm{C} \cdots \mathrm{H}$ contacts; $(f) \mathrm{C} \cdots \mathrm{O} / \mathrm{O} \cdots \mathrm{C}$ contacts.
tion of the benzene ring, and replacing one hydrogen of the methyl group, yielded 259 hits. A similar fragment, but with 'any halogen' at the 4 -position on the ring, gave 92 hits. With the halogen restricted to fluorine, twelve hits were returned, and with an isopropyl group attached to the nitrogen atom, only one match was found: CSD refcode QEMHOG (Gao \& $\mathrm{Ng}, 2006$ ): this structure has a 1,3-benzothiazol-2-yl-oxy group attached to the methylene carbon atom of the search fragment.

A search of the CSD for non-bonded close contacts (up to $3.1 \AA$ ) between $\mathrm{S}=\mathrm{O}$ oxygen atoms and a benzene-ring centroid (with 'any substituent') returned 154 hits, none of which have much else in common with $\mathbf{I}$. A crystallographic and computational study of interactions between oxygen lone pairs and aromatic rings (albeit involving carbon-bound oxygen atoms) was presented by Gung et al. (2008).

There are several other related structures in the CSD, namely: thiamphenicol, D-threo-2,2-dichloro- $N$-\{2-hydroxy-1-
(hydroxymethyl)-2-[4-(methylsulfonyl)phenyl]ethyl\}acetamide (CABCIR01; Ghosh et al., 1987), 2,2-dichloro- $N$ - $\{[1-$ (fluoromethyl)-2-hydroxy-2-[4- (methylsulfonyl)phenyl]ethyl\}acetamide (GAWNIC; Cheng et al., 2005), $N$-(2,6-di-methylphenyl)-2-(2-\{3-[4-(methylsulfonyl)phenyl]-1,2,4-oxa-diazol-5-yl\}phenoxy)acetamide (AFIFIF; Wang et al., 2007), $N$-(4-chloro-2-nitrophenyl)- $N$-(methylsulfonyl)acetamide (WOGWEV; Zia-ur-Rehman et al., 2008), N-(4-methoxy-2-nitro-phenyl)- $N$-(methylsulfonyl)acetamide (QOTNAP; Zia-ur-Rehman et al., 2009), 2-chloro-N-(4-chloro-2-(2-chlorobenzoyl)phenyl)acetamide (DUPLUW; Dutkiewicz et al., 2010), 2 -chloro- $N$-[2-(2-fluorobenzoyl)-4-nitrophenyl]- $N$ methylacetamide (EXIVEN; Siddaraju et al., 2011), 2-phenyl-$N$-(pyrazin-2-yl)acetamide (ROJNAH; Nayak et al., 2014) and 2-(perfluorophenyl)acetamide (LAMRAW; Novikov et al., 2022).

## 5. Synthesis, crystallization and spectroscopic details

In a 250 ml flask (with a nitrogen inlet and a septum) was placed 5 g of 4-fluoro- N -isopropylbenzenamine dissolved in 50 ml of acetonitrile. After cooling to $273 \mathrm{~K}, 6.7 \mathrm{~g}$ of triethylamine and 4.11 g of 2-(methylthio)acetyl chloride were added. The mixture was stirred at room temperature for 5 h . After this, 100 ml of water were added and the mixture was extracted three times, each with 100 ml of methyl tert-butyl ether (MTBE). The combined organic phases were dried over $\mathrm{MgSO}_{4}$ and the solvent was evaporated under reduced pressure. The crude product, N -(4-fluorophenyl)- N -isopropyl-2(methylthio)acetamide, was used for the next stage with purification ( 7.5 g ).

To a 250 ml round-bottomed flask (with a nitrogen inlet and a septum) was added 7.5 g of N -(4-fluorophenyl)- N -isopropyl-2-(methylthio)acetamide dissolved in 150 ml of dichloromethane. After cooling to $263-273 \mathrm{~K}, 13.37 \mathrm{~g}$ of metachloroperbenzoic acid in 100 ml dichloromethane was added

slowly at the same temperature. The mixture was stirred at room temperature for 5 h . After this, 200 ml of water were added and the organic layer was separated, and washed with 100 ml of $10 \%$ sodium bicarbonate twice. The organic phases were dried over $\mathrm{MgSO}_{4}$ and the solvent was evaporated under reduced pressure. The crude product was purified by chromatography over $\mathrm{SiO}_{2}$ (hexane:ethyl acetate $9: 1 \mathrm{v} / \mathrm{v}$ ). The title compound was recrystallized from diethyl ether solution in the form of colorless plates. The overall reaction scheme is shown in Fig. 4.

MS m/z: 273.45 $(M)^{+}$.

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. Hydrogen atoms were found in difference-Fourier maps, but subsequently included in the refinement using riding models, with constrained $\mathrm{C}-\mathrm{H}_{\circ}$ distances set to $0.95 \AA\left(\mathrm{Csp}{ }^{2} \mathrm{H}\right), 0.98 \AA\left(\mathrm{RCH}_{3}\right), 0.99 \AA$
$\left(R_{2} \mathrm{CH}_{2}\right)$ and $1.00 \AA\left(R_{3} \mathrm{CH}\right) . U_{\text {iso }}(\mathrm{H})$ parameters were set to values of either $1.2 U_{\text {eq }}$ or $1.5 U_{\text {eq }}\left(R \mathrm{CH}_{3}\right.$ only) of the attached atom.

## Special details

Experimental. The crystal was mounted using polyisobutene oil on the tip of a fine glass fibre, which was fastened in a copper mounting pin with electrical solder. It was placed directly into the cold gas stream of a liquid-nitrogen based cryostat (Hope, 1994; Parkin \& Hope, 1998).
Diffraction data were collected with the crystal at 90 K , which is standard practice in this laboratory for the majority of flash-cooled crystals.
Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. Refinement progress was checked using Platon (Spek, 2020) and by an R-tensor (Parkin, 2000). The final model was further checked with the IUCr utility checkCIF.
