The molecular structure of tricarbonyl[η^4 -6-exo-(triphenylphosphino)cyclohepta-2,4-dien-1-one]iron(0) tetrafluoroborate dichloromethane hemisolvate, $[\text{Fe}(\text{C}_{28}\text{H}_{22}\text{O}_4)(\text{CO})_3]\text{BF}_4 \cdot 0.5\text{CH}_2\text{Cl}_2$, as determined by single-crystal X-ray diffraction is reported. The two independent tricarbonyl[η^4 -6-exo-(triphenylphosphino)cyclohepta-2,4-dien-1-one] iron(0) cations and their corresponding anions form dimers, which constitute the asymmetric unit of the structure parallel to the (100) plane. Solid-state stability within that asymmetric unit as well as between neighboring dimeric units is afforded by C—H···O and C—H···F hydrogen bonds and C—H··· π and Y—X··· π ($Y = \text{B}, \text{C}; X = \text{F}, \text{O}$) interactions, which yield diperiodic sheets and a three-dimensional extended network.

1. Chemical context

This compound was prepared as part of a Course-based Undergraduate Research Experience (CURE) (Stone *et al.*, 2020; Huang *et al.*, 2019). The foundation of this CURE was to further examine addition reactions to tricarbonyl(tropone)-iron(0) (**I**) and tricarbonyl(η^5 -ketocycloheptadienyl)iron(0) tetrafluoroborate (**II**) (Fig. 1). The research focus of one author lies in the synthesis of unique and diverse azapolyyclic skeletons from common synthetic building blocks such as compound **I** due to the biological importance of such scaffolds. Although seven-membered carbocyclic rings are found in a number of biologically active natural products (Shoemaker & Griffith, 2021), their synthesis tends to present a greater challenge compared to similar five- or six-membered rings because of the increased enthalpic and entropic barriers associated with their formation (Phelan *et al.*, 2020; Huang *et al.*, 2018). The addition of a number of different nucleophiles to compound **II** has previously been reported, including amines (Phelan *et al.*, 2020), azide, and cyanide (Eisenstadt, 1975). This raised the question as to whether or not triphenylphosphine would be sufficiently nucleophilic to react

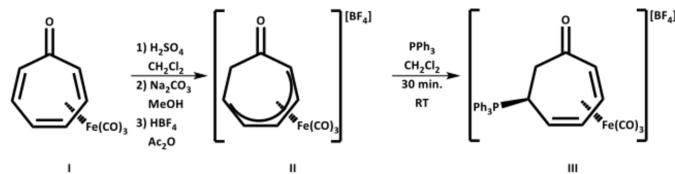

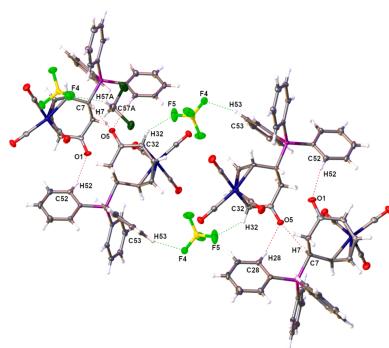

Figure 1

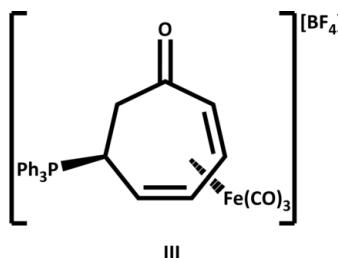

Tricarbonyl(tropone)iron(0) (**I**), tricarbonyl(η^5 -ketocycloheptadienyl)-iron(**II**), and tricarbonyl[η^4 -6-exo-(triphenylphosphino)cyclohepta-2,4-dien-1-one]iron(0) tetrafluoroborate (**III**) and the procedure outlining the synthesis of **III** from **I** and **II**.

with compound **II**. Previously, the reaction of several phosphines (PEt_3 , $\text{P}''\text{Pr}_3$, $\text{P}''\text{Bu}_3$ or PMe_2Ph) with tricarbonyl(η^5 -cycloheptadienyl)iron(II) tetrafluoroborate in methylene chloride resulted in the formation of the corresponding tricarbonyl[η^4 -(5-*exo*-phosphine)cycloheptadiene]iron(0) tetrafluoroborate (Brown *et al.*, 1982). Similar to that system, the reaction of compound **II** and triphenylphosphine resulted in the formation of tricarbonyl[η^4 -6-*exo*-(triphenylphosphino)cyclohepta-2,4-dien-1-one]iron(0) tetrafluoroborate (**III**) (Fig. 1). Ultimately, this and similar phosphonium salts could be a precursor for Wittig olefinations that would provide efficient access to tropone rings with diverse substituents.

2. Structural commentary

The single crystal X-ray structure of **III** crystallizes in the centrosymmetric triclinic space group $P\bar{1}$ (Fig. 2). The asymmetric unit consists of two tricarbonyl[η^4 -6-*exo*-(triphenylphosphino)cyclohepta-2,4-dien-1-one]iron(0) cations, two tetrafluoroborate anions (to balance the charge), and an interstitial CH_2Cl_2 solvent molecule lying in solvent-accessible voids of $\sim 101 \text{ \AA}^3$. The iron tricarbonyl moieties adopt piano stool orientations with the cyclohepta-2,4-dien-1-one group (Fig. 2). Closer analysis of the thermal parameters of the

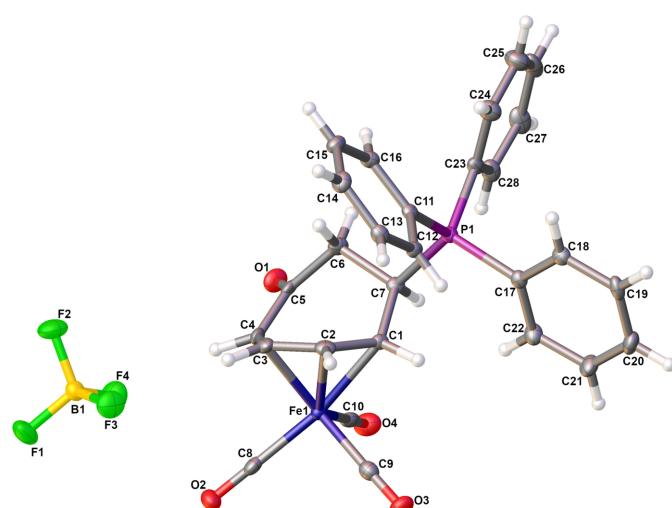

Figure 2

Single-crystal structure of one tricarbonyl[η^4 -6-*exo*-(triphenylphosphino)cyclohepta-2,4-dien-1-one]iron(0) tetrafluoroborate (**III**) from the asymmetric unit with anisotropic displacement ellipsoids at the 50% probability level. The interstitial CH_2Cl_2 has been removed for the sake of clarity.

Symmetry codes: (i) $-x+2, -y+1, -z+2$; (ii) $-x+1, -y+1, -z+2$; (iii) $x-1, y, z$; (iv) $x-1, y+1, z$; (v) $-x+2, -y+1, -z+1$; (vi) $x+1, y-1, z$.

$[\text{BF}_4^-]$ anions and CH_2Cl_2 solvent molecule within the asymmetric unit showed no qualitative evidence of disorder.

3. Supramolecular features

Solid-state stability between the molecules of **III** within the asymmetric unit is afforded by an array of C—H \cdots O and C—H \cdots F hydrogen bonds (Table 1) as determined through PLATON analysis (Spek, 2020). The two independent tricarbonyl[η^4 -6-*exo*-(triphenylphosphino)cyclohepta-2,4-dien-1-one]iron(0) cations from the asymmetric unit lie parallel to the (100) plane and are stabilized by intermolecular

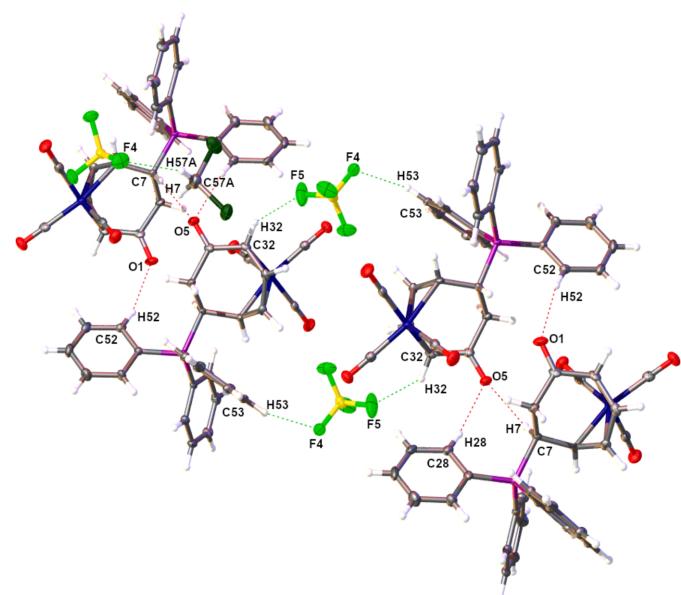

Figure 3

View of the C—H \cdots O and C—H \cdots F hydrogen bonds from the (101) plane of **III**. When coupled with the C—H \cdots π and Y—X \cdots π ($Y = B, C$; $X = F, O$) interactions, this repeat unit extends into a three-dimensional network. Anisotropic displacement ellipsoids have been set to the 50% probability level.

C—H \cdots O hydrogen bonds. The addition of C—H \cdots F hydrogen bonding involving the $[\text{BF}_4]^-$ anions increases the dimensionality of the solid-state structure into both diperiodic sheets and extended 3D networks, which also contain C—H \cdots π and Y—X \cdots π ($Y = \text{B}, \text{C}; X = \text{F}, \text{O}$) interactions (Table 2) according to PLATON (Spek, 2020) (Figs. 3 and 4). The resulting 3D network was also found to contain solvent-accessible voids of $\sim 101 \text{ \AA}^3$ within which the interstitial CH_2Cl_2 was located (Fig. 5).

The $Z' > 1$ nature of the structural model for **III** suggests the presence of structural differences between molecules within the asymmetric unit. Barring differences in the thermal parameters for the various atoms within the independent components, overlaying the tricarbonyl[η^4 -6-exo-(triphenylphosphino)cyclohepta-2,4-dien-1-one]iron(0) cations and

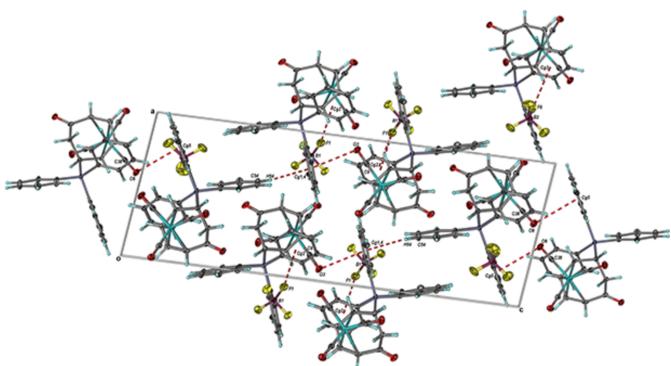

Figure 4
Projection of the C—H \cdots π and Y—X \cdots π ($Y = \text{B}, \text{C}; X = \text{F}, \text{O}$) interactions in the *ac* plane of **III**. Their combination with the hydrogen bonds yields a three-dimensional extended network in the solid state. Anisotropic displacement ellipsoids have been set to the 50% probability level ($C_g =$ ring centroids).

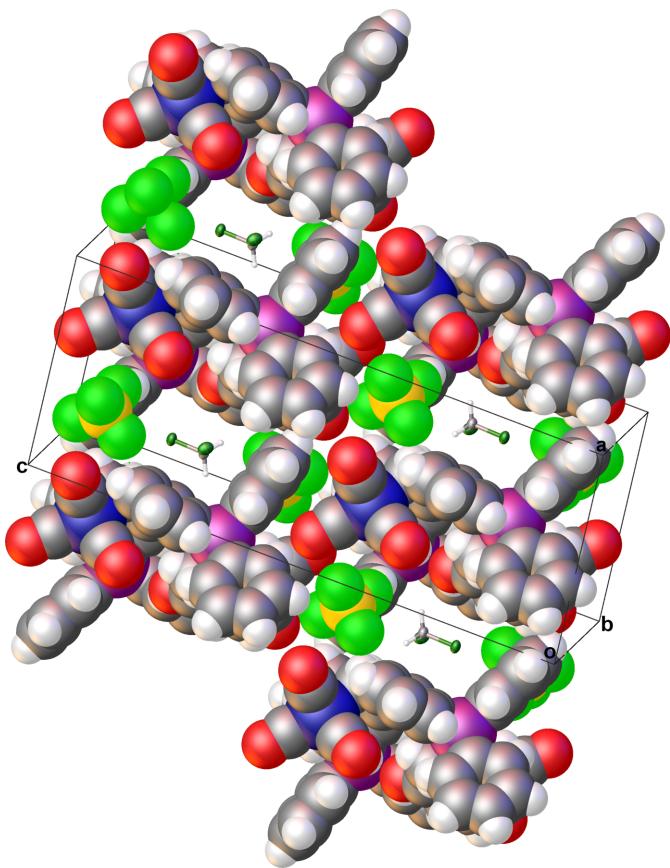

Figure 5
View into the (120) plane showing the interstitial CH_2Cl_2 solvent molecules lying within the solvent-accessible voids of **III**. These voids are generated from the packing supported by the C—H \cdots O and C—H \cdots F hydrogen bonds and C—H \cdots π and Y—X \cdots π ($Y = \text{B}, \text{C}; X = \text{F}, \text{O}$) interactions. The anisotropic displacement ellipsoids for CH_2Cl_2 have been set to the 50% probability level.

Figure 6
Molecular overlay of between both cations constituting the symmetric unit of **III** demonstrating that the greatest disparity between them exists within the torsion angles of the the phenyl rings. The first tricarbonyl[η^4 -6-exo-(triphenylphosphino)cyclohepta-2,4-dien-1-one]iron(0) tetrafluoroborate is in black while the second is in yellow. Anisotropic displacement ellipsoids have been set to the 50% probability level.

Table 3 $X-Y\cdots\pi$ interactions (\AA , $^\circ$).

$C_{g1}\cdots C_{g5}$ are the centroids of the C11–C16, C17–C22, C39–C44 and C45–C50 rings, respectively.

$X-Y\cdots C_g$	$Y\cdots C_g$	$X\cdots C_g$	$X-H\cdots C_g$
C54–H54 $\cdots C_{g2}^i$	2.99	3.929 (3)	171
B1–F1 $\cdots C_{g1}^{ii}$	3.429 (2)	4.790 (3)	165.56 (17)
B2–F6 $\cdots C_{g3}^{iii}$	3.653 (2)	4.913 (3)	150.99 (17)
C9–O3 $\cdots C_{g2}^{iv}$	3.393 (2)	3.858 (3)	105.37 (19)
C38–O8 $\cdots C_{g4}^v$	3.467 (2)	3.925 (3)	105.10 (18)

Symmetry codes: (i) $-1+x, 1+y, z$; (ii) $x, 1+y, z$; (iii) $1+x, -1+y, z$; (iv) $2-x, 1-y, 1-z$; (v) $1-x, 1-y, 2-z$.

[BF₄][−] anions showed that the anions had better alignment while differences in the some of the constituent torsion angles within phenyl rings from the tricarbonyl[η^4 -6-*exo*-(triphenylphosphino)cyclohepta-2,4-dien-1-one]iron(0) cations were more pronounced visually (Fig. 6). Table 3 summarizes the torsion angles from the phenyl rings of the tricarbonyl[η^4 -6-*exo*-(triphenylphosphino)cyclohepta-2,4-dien-1-one]iron(0) cations.

4. Database survey

The structure of this report is not found in the Cambridge Structural Database (CSD version 5.43; Groom *et al.*, 2016). To date, the structures of six tricarbonyl(η^4 -tropone derivative)iron(0) compounds have been reported. In addition to the structure of compound **I** (Dodge, 1964), three of the remaining reports have one additional substituent in the 6-position, H (Sotokawa *et al.*, 1987), *t*-Bu (Coquerel *et al.*, 2002) and morpholi-4-yl (Huang *et al.*, 2018). From the various reports, comparison of their structural features suggested that the presence of the formally cationic phosphorous had minimal impact on the bond lengths.

5. Synthesis and crystallization

All chemicals were purchased from commercial vendors and used as is. Compounds **I** and **II** were prepared according to literature procedures (Huang *et al.*, 2019). NMR spectra were obtained in *d*₃-acetonitrile using a Bruker Avance III HD 400 FT-NMR spectrometer. The synthesis was performed using standard Schlenk conditions as outlined in Fig. 1, but all subsequent manipulations of the product were conducted in air. Compound **II** (0.0054 g, 0.016 mmol) and triphenylphosphine (0.0043 g, 0.016 mmol) were added to a 50 mL round-bottom flask along with a stir bar. Methylene chloride (12 mL) was added, and the reaction mixture was stirred at room temperature for 30 minutes. A color change from pastel yellow to a darker yellow was observed. The solution was reduced *in vacuo* to approximately 5 mL and the resulting solution was layered with diethyl ether (7 mL) before being placed in the freezer for 48 h. The sample formed a pastel yellow solid and was filtered *via* cannula. The solid was dried *in vacuo* to give the desired product (0.0085 g, 88% yield). Crystals were grown by slow vapor diffusion of diethyl ether at room temperature into a solution of the compound in

methylene chloride. ¹H NMR (400 MHz, CD₃CN): δ 7.87 (*m*, 9H, H_{meta}, H_{para}), 7.75 (*m*, 6H, H_{ortho}), 5.80 (*t*, J = 6.2 Hz, 1H, H4), 5.20 (*t*, J = 7.0 Hz, 1H, H1), 4.86 (*td*, J = 12.7, 4.7 Hz, 1H, H7), 3.21 (*dd*, J = 13.0, 7.5 Hz, 1H, H3), 3.16 (*d*, J = 6.6 Hz, 1H, H2), 2.18 (*m*, 1H, H6A/B), 1.99 (*q*, J = 12.2 Hz, 1H, H6A/B); ³¹P{¹H} NMR (162 MHz, CD₃CN): δ 23.3 (*s*); ¹³C{¹H} NMR (100 MHz, CD₃CN): δ 207.9 (*s*, No DEPT, C8–10), 202.6 (*d*, J = 15.4 Hz, No DEPT, C5), 135.9 (*d*, J = 3.2 Hz, DEPT +, C_{para}), 134.8 (*d*, J = 9.5 Hz, DEPT +, C_{meta}), 131.1 (*d*, J = 12.7 Hz, DEPT +, C_{ortho}), 117.2 (*d*, J = 81.6 Hz, No DEPT, C_{ipso}), 94.6 (*s*, DEPT +, C4), 89.8 (*s*, DEPT +, C1), 56.7 (*s*, DEPT +, C2), 49.5 (*d*, J = 7.4 Hz, DEPT +, C3), 41.2 (*d*, J = 31.8 Hz, DEPT +, C7), 37.2 (*s*, DEPT –, C6). Peaks were assigned using COSY, HMBC and HSQC NMR spectra. Protons of the tropone ring are labeled by the number of the carbon atom to which they are bonded. IR (cm^{−1}, CH₃CN): 2059 (*m*, Fe—C≡O), 2014 (*m*, Fe—C≡O), 1966 (*vs*, Fe—C≡O), 1710 (*m*, C=O), 1609 (*m*, C=C).

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 4. All non-hydrogen atoms were refined anisotropically. H atoms bound to carbon were positioned geometrically and constrained to ride on their parent atoms. $U_{\text{iso}}(\text{H})$ values were set to a multiple of $U_{\text{eq}}(\text{C})$ with 1.2 times all CH and CH₂ groups.

H-atom parameters constrained

$w = 1/[\sigma^2(F_o^2) + (0.0554P)^2 + 0.9998P]$

where $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} = 0.001$

$\Delta\rho_{\max} = 0.54$ e Å⁻³

$\Delta\rho_{\min} = -0.43$ e Å⁻³

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
