In the title compound C₁₉H₂₄N₂OS, intermolecular N—H···O hydrogen bonds generate *R*₂(8) ring motifs, forming dimers with an interaction energy of −70.5 kJ mol^{−1}. A short S···C interaction produces another dimer with an interaction energy of −30.6 kJ mol^{−1}. The intermolecular interactions were quantified using Hirshfeld surface analysis. The two-dimensional fingerprint plots indicate that the major contributions to the crystal packing are from H···H (67.9%), C···H (13.7%), O···H (7.3%) and S···H (4.3%) interactions.

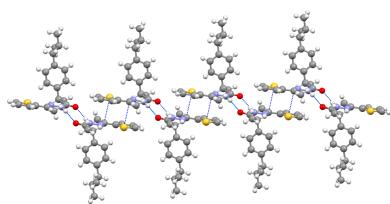

1. Chemical context

Derivatives of ibuprofen have been synthesized to enhance the efficacy and reduce the side effects commonly associated with traditional NSAIDs (Ahmadi *et al.*, 2017). These derivatives have shown promising results in preliminary studies, particularly regarding anti-inflammatory, analgesic, and antimicrobial activities (Sujith *et al.*, 2009; Dhakane *et al.*, 2014). Compared to other derivatives of NSAIDs, ibuprofen hydrazides may offer distinct advantages, although comprehensive clinical comparisons are still limited (Kamms & Hadi, 2023). Based on the above studies, we herein report the crystal structure of the ibuprofen hydrazide derivative 2-[4-(2-methylpropyl)phenyl]-*N'*-[(1*Z*)-1-(thiophen-2-yl)ethylidene]propanehydrazide (**1**).

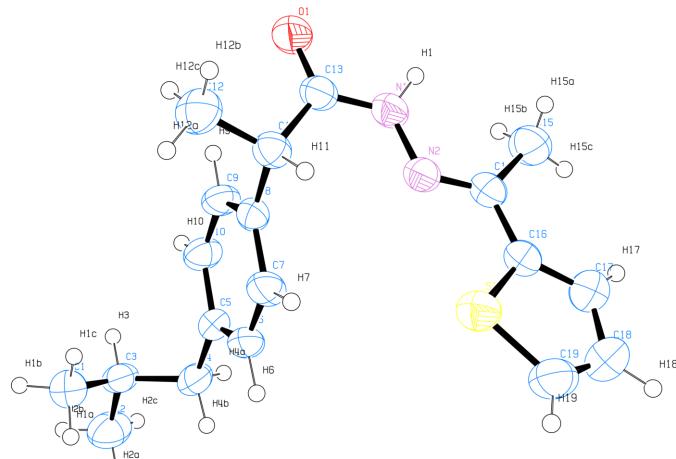

2. Structural commentary

The title compound crystallizes in the triclinic space group *P*ī with one molecule in the asymmetric unit (Fig. 1). The lengths of the C—S bonds C16—S1 and C19—S1 are 1.7225 (14) and 1.7115 (18) Å, respectively, while the carbonyl bond distance C13—O1 is 1.2297 (15) Å. The torsion angle N1—N2—C14—C16 is 176.95 (10)°, while C8—C11—C13—O1 is 103.88 (14)°. The benzene (*A*, C5—C10; r.m.s.d. = 0.004 Å) and thiophene (*B*, C16—C19/S1; r.m.s.d. = 0.004 Å) rings are not coplanar, subtending a dihedral angle of 86.69 (4)°.

The molecular structure of **1** with displacement ellipsoids drawn at the 50% probability level.

3. Supramolecular features

In the crystal, N1—H1 \cdots O1 hydrogen bonds [2.119 (18) Å; Table 1] lead to the formation of dimers with an $R_2^2(8)$ motif. Energy calculations at the B3LYP/6-31G(d, p) level were performed using *Crystal Explorer 21.5* (Mackenzie *et al.*, 2017; Spackman *et al.*, 2021) software with the CIF as the input file. The dimer energy was found to be $-70.5 \text{ kJ mol}^{-1}$. In the crystal, each molecule in the dimer also forms an S1 \cdots C14 short interaction [3.5214 (14) Å; symmetry operation $-x, 2 - y, 2 - z$], forming another dimer with an $R_2^2(6)$ motif and thereby forming a chain running in the *b*-axis direction (Fig. 2). The energy of the dimer formed by this short interaction was calculated to be $-30.6 \text{ kJ mol}^{-1}$.

4. Hirshfeld surface analysis

Hirshfeld surface analysis (Hirshfeld, 1977; Spackman & Jayatilaka, 2009) was conducted using *Crystal Explorer* (Spackman *et al.*, 2021) to visualize and quantify the intermolecular interactions in the title molecule. The Hirshfeld

indicate that the major contributions to the crystal packing are from H···H (67.9%), C···H (13.7%), O···H (7.3%) and S···H (4.3%) interactions.

5. Database Survey

A search of the Cambridge Structural Database (CSD, updated to January 2025; Groom *et al.*, 2016) for the 2-(4-isobutylphenyl)-N'-methylpropanehydrazide moiety yielded two closely related structures: 1-[2-(4-isobutylphenyl)prop-anooyl]thiosemicarbazide (**2**; CSD refcode HOLQIJ; Fun & Kia *et al.*, 2009) and *N*-(2,4-dioxo-1,3-thiazolidin-3-yl)-2-(4-isobutylphenyl)propanamide (**3**; CSD refcode HUCTUV; Fun & Goh *et al.*, 2009). In compound **2**, the crystal structure features N—H···O and N—H···S hydrogen bonds, with donor–acceptor distances of 2.09 (15) and 2.495 (13) Å, respectively, leading to a supramolecular architecture. In compound **3**, the supramolecular structure is governed by N—H···O hydrogen bonding [1.94 (3) Å], along with several C—H···O interactions.

6. Synthesis and crystallization

The title compound was obtained by refluxing 2-[4-(2-methylpropyl)phenyl]propanehydrazide (0.01 mol) and 2-acetyl thiophene (0.01 mol) in ethanol (20 ml) by adding a catalytic amount of concentrated sulfuric acid for 1 h. The excess solvent was removed under reduced pressure. The solid product obtained was filtered, washed with ethanol, and dried. Single crystals suitable for X-ray analysis were obtained by slow evaporation from an ethanol solution with 80% yield and melting point 340–342 K.

7. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. H atoms were refined using a DFIX restraint to ensure chemically reasonable bond lengths and angles, with their $U_{\text{iso}}(\text{H})$ values constrained to 1.5 times the U_{eq} of their pivot atoms for terminal sp^3 carbon atoms and 1.2 times for all other carbon atoms.

Acknowledgements

The authors thank the Department of Chemistry, Sir Syed College, Taliparamba for providing the computational lab facility. The authors thank the Laboratory of X-ray Crystallography, Department of Physics, Periyar University, Salem, for assistance with data collection for single-crystal XRD studies.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.

Hydrogen-bond geometry (\AA , °)

$D\cdots H$	$D—H$	$H\cdots A$	$D\cdots A$	$D—H\cdots A$
N1—H1 ⁱ —O1 ⁱ	0.859 (18)	2.119 (18)	2.9537 (15)	163.6 (16)

Symmetry code: (i) $-x, -y+3, -z+2$.

Table 2. The energy values (eV) of global reactivity descriptors for the title compound.

Global reactivity Descriptors	Calculated values (eV)
E(HOMO)	-6.0826
E(LUMO)	-1.7796
Energy gap	4.303
Electron affinity (A)	1.7796

Ionisation energy (I)	6.0826
Electronegativity (χ)	3.9311
Chemical hardness (η)	2.1515
Chemical potential (μ)	-3.9311
Chemical hardness (S)	0.2324
Electrophilicity index (ω)	3.5913
