The new phenytoin analogue 5,5-diphenyl-3-(2-propyn-1-yl)imidazolidine-2,4-dione,  $C_{18}H_{14}N_2O_2$  (**3**), was obtained through an alkylation reaction with propargyl bromide *via* the phase-transfer catalysis method, and its structure was determined *via* single-crystal X-ray diffraction analysis. The asymmetric unit of **3** consists of two independent molecules differing mainly in the orientation of the propynyl group. Each molecule forms an inversion dimer through pairs of  $N_2-H\cdots O_2$  hydrogen bonds. The crystal structure is further consolidated by  $C-H\cdots O$  and  $C-H\cdots \pi$  interactions. The contributions of the different interactions towards the crystal packing were further analysed using Hirshfeld surface and fingerprint plots, showing that the largest contribution comes from the  $H\cdots H$  contacts (45%).

## 1. Chemical context

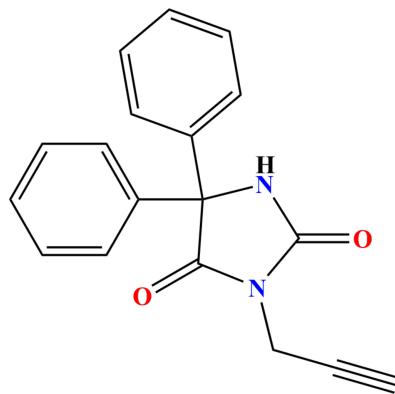

Hydantoin, also known as glycolylurea or 2,4-imidazolidinedione, is a saturated heterocyclic compound derived from imidazole. Phenytoin, 5,5-diphenylimidazolidine-2,4-dione, is a molecule belonging to the hydantoin group, which is used in pharmacy mainly as an antiepileptic (Giunchi *et al.*, 2019; El Moutaouakil Ala Allah *et al.*, 2024a). The main site of action appears to be the motor cortex, where it inhibits the spread of seizure activity. Phenytoin is indicated for the control of grand mal and psychomotor seizures (Guerrab *et al.*, 2022a). It is also applicable for various diseases, as it has antiarrhythmic (Handzlik *et al.*, 2012), anti-HIV (Vamecq *et al.*, 1998), cytotoxic (Guerrab *et al.*, 2023a), antiproliferative (Aboeldahab *et al.*, 2018) and antibacterial effects (El Moutaouakil Ala Allah *et al.*, 2024b). Various methods for synthesizing hydantoins have been reported, including the reaction of benzyls with urea in an ethanolic solution of potassium or sodium hydroxide (Guerrab *et al.*, 2022b, 2023b; Allah *et al.*, 2024; El Moutaouakil Ala Allah *et al.*, 2023). Moreover, alkylation-based chemical modifications of phenytoin are seen to strengthen and expand its biological activity (Guerrab *et al.*, 2020a). Some analogs have also been synthesized and evaluated for their industrial properties (e.g. Ettahiri *et al.*, 2024). Our interest in hydantoins results from their simple synthesis and the ease with which X-ray quality crystals can be grown. In this context, we present in this study a new phenytoin obtained through an alkylation reaction with propargyl bromide *via* the phase-transfer catalysis method. This paper presents the crystal structure of novel phenytoin analogue **3**. A

Hirshfeld surface analysis was performed to analyze the intermolecular interactions.

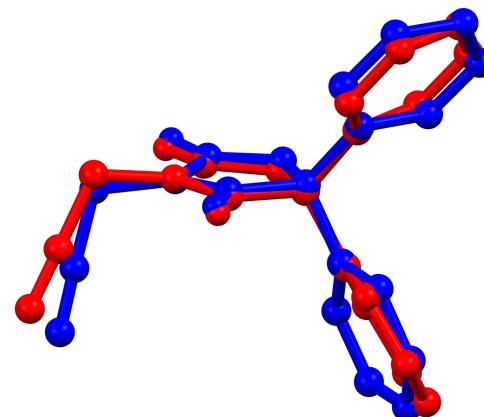

## 2. Structural commentary

The asymmetric unit consists of two independent molecules (*A* and *B*) differing modestly in the rotational orientations of the phenyl rings and most obviously in the orientation of the propynyl group (Fig. 1). Thus the C2*A*–N1*A*–C4*A*–C41*A* torsion angle is  $-80.1(2)^\circ$ , while C2*B*–N1*B*–C4*B*–C41*B* is  $-68.4(2)^\circ$ . The overlay of molecule *A* (red) and molecule *B* (blue) is shown in Fig. 2; the r.m.s. deviation for non-H atoms is 0.325 Å. As in many related molecules, the dihedral angles between the mean planes of the five-membered ring and those of the phenyl rings is larger than  $50^\circ$ . In molecule *A*, these are  $53.58(8)$  and  $56.68(9)^\circ$  while in molecule *B*, they are  $56.81(8)$  and  $74.26(9)^\circ$ , another indication of the different conformations of the two independent molecules. Bond lengths and interbond angles are as expected for this type of compound. The five-membered rings C1*A*–C3*A*/N1*A*/N2*A* (ring *A*) and C1*B*–C3*B*/N1*B*/N2*B* (ring *B*) are both essentially planar, with r.m.s. deviations of 0.010 and 0.044 Å, respectively. For ring *A*, atom N1*A* shows the largest deviation [0.009(1) Å],

**Figure 1**

The asymmetric unit with labeling scheme and 50% probability ellipsoids. The C–H···O hydrogen bond is depicted by a dashed line.

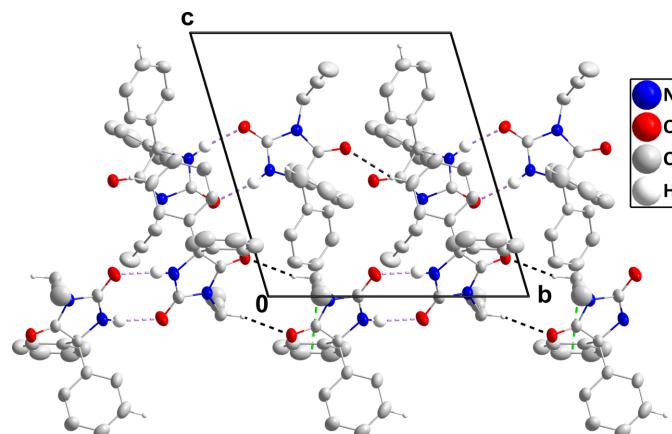

**Figure 2**

Overlay of molecules *A* (red) and *B* (blue) present in the asymmetric unit of the title compound.

while atoms O1*A* and O2*A* deviate by  $-0.035(1)$  and  $0.028(1)$  Å from the mean plane. For ring *B*, the largest deviation of  $-0.038(2)$  Å is shown by atom C2*B*, while atoms O1*B* and O2*B* deviate  $-0.097(1)$  and  $-0.047(1)$  Å from the mean plane.

## 3. Supramolecular features

In the crystal, each independent molecule forms an inversion dimer through pairs of N2–H2···O2 (*A* or *B*) hydrogen bonds (Table 1). For molecule *A*, these dimers are connected into chains extending along the *b*-axis direction by inversion-related C4*A*–H4*AA*···O1*A* hydrogen bonds (Table 1 and Fig. 3). The dimers of molecule *B* are linked to the above-mentioned chains by C15*A*–H15*A*···O1*B* hydrogen bonds and C8*B*–H8*B*···Cg<sub>2</sub> interactions (Table 1 and Fig. 3). These supramolecular aggregates are in turn connected by C15*B*–H15*B*···Cg<sub>3</sub> interactions (Table 1). Cg<sub>2</sub> and Cg<sub>3</sub> are the centroids of the C5*A*–C10*A* and C11*A*–C16*A* benzene rings, respectively.

**Figure 3**

Packing viewed along the *a*-axis direction with N–H···O and C–H···O hydrogen bonds depicted, respectively, by violet and black dashed lines. The C–H···π(ring) interactions are depicted by green dashed lines and non-interacting hydrogen atoms are omitted for clarity.

**Table 1**Hydrogen-bond geometry ( $\text{\AA}$ ,  $^\circ$ ).

$Cg_2$  and  $Cg_3$  are the centroids of the C5A–C10A and C11A–C16A benzene rings, respectively.

#### 4. Database survey

A search of the Cambridge Structural Database (CSD, 2023.3.1; Groom *et al.*, 2016) with the fragment shown in Fig. 4 ( $R = \text{C}$ ) yielded 25 structures, of which 19 were deemed closest to the title molecule, since all of the substituents,  $R$ , were mainly hydrocarbon groups. These are listed in Table 2 from which it is apparent that the dihedral angles between the mean planes of the two phenyl groups and that of the five-membered ring to which they are attached range from  $51.23(6)^\circ$  (WUGCEJ) to as large as  $83.89(16)^\circ$  (YOFMUE). The two angles may also be nearly equal as in FEHPUG or differ by as much as  $31.81^\circ$  as in WUGCEJ. The range of dihedral angles and the difference between them in a particular molecule is likely due to packing considerations, but there does not appear to be a simple correlation with the space group or the size of the substituent  $R$ .

#### 5. Hirshfeld surface analysis

*CrystalExplorer* (Spackman *et al.*, 2021) was used to perform the Hirshfeld surface (HS) analysis. A full description of the procedures and the interpretation of the results obtained has been published (Tan *et al.*, 2019). Fig. 5 presents the  $d_{\text{norm}}$  surface for molecule  $A$ , together with several near neighbors

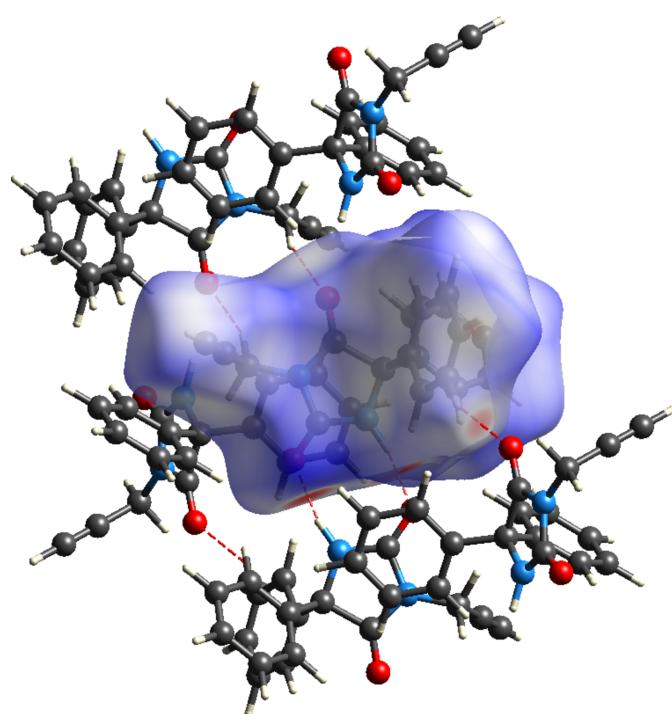

**Figure 4**

The search fragment used for the database search.

consisting of both molecules  $A$  and  $B$ . A portion of the chain of dimers formed by the  $A$  molecules can be seen in the center of the figure, while at the bottom of the surface the  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds are shown as two intense red spots. The lighter red spot at the lower right corresponds to the  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bond that links molecules  $A$  and  $B$ . Fig. 6 shows the 2-D fingerprint plots for all intermolecular interactions (*a*) and those specifically representing  $\text{H}\cdots\text{H}$  (*b*),  $\text{C}\cdots\text{H}/\text{H}\cdots\text{C}$  (*c*) and  $\text{O}\cdots\text{H}/\text{H}\cdots\text{O}$  (*d*) interactions. The largest contribution to the intermolecular interactions comes from the  $\text{H}\cdots\text{H}$  contacts (45%), which is consistent with the periphery of the molecule being largely hydrogen in nature and can be attributed to van der Waals contacts. The  $\text{C}\cdots\text{H}/\text{H}\cdots\text{C}$  contacts contribute 32.1% and appear as a pair of blunt peaks at  $d_e + d_i \simeq 3.2 \text{ \AA}$ . These can be primarily attributed to the  $\text{C}-\text{H}\cdots\pi(\text{ring})$  interactions. The last significant contribution is from the  $\text{O}\cdots\text{H}/\text{H}\cdots\text{O}$  interactions (17.9%) which appear as a pair of sharp spikes at  $d_e + d_i \simeq 2.2 \text{ \AA}$ . These represent the  $\text{N}-\text{H}\cdots\text{O}$  and the  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds, respectively. All other intermolecular contacts, *e.g.*  $\text{N}\cdots\text{H}/\text{H}\cdots\text{N}$ ,  $\text{C}\cdots\text{N}$ ,  $\text{O}\cdots\text{C}$ , *etc.*, contribute less than 2% to the total. The HS surface for molecule  $B$  is virtually identical to that for

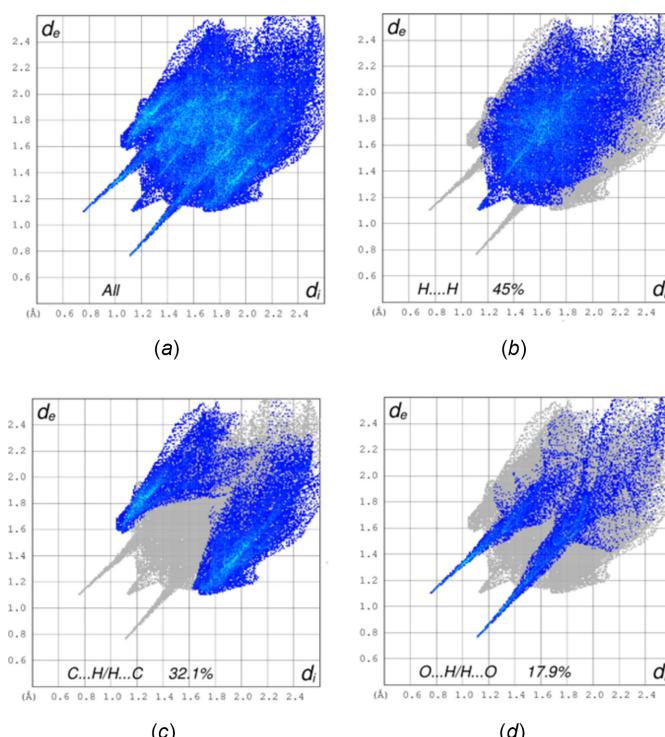

**Table 2**Dihedral angles ( $^\circ$ ) between the phenyl rings and the five-membered ring for related molecules.

$\text{H}\cdots\text{H}$  contacts, 34.7% for  $\text{C}\cdots\text{H}/\text{H}\cdots\text{C}$  contacts and 18.8% for  $\text{O}\cdots\text{H}/\text{H}\cdots\text{O}$  contacts. Again, other contacts are less than 2% each.

## 6. Synthesis and crystallization

The reaction scheme for the synthesis of the title compound is shown in Fig. 7. To a solution of phenytoin **1** (0.5 g, 2 mmol) in DMF (10 mL), in the presence of  $\text{K}_2\text{CO}_3$  (2.2 mmol), propargyl bromide **2** (2.2 mmol) was added dropwise along with a catalytic amount of BTBA (benzyl tributyl ammonium bromide). The mixture was stirred at room temperature for 2 h. After filtration of the salts, the solvent was evaporated, and the resulting residue was purified by recrystallization in ethanol, yielding colorless crystals of **3**.

**Yield** = 96%, **m.p.** = 408–410 K. **FT-IR** (ATR,  $\text{cm}^{-1}$ ): 3375 (CH propargyl), 3060–3080, (CH aromatic), 1765 ( $\text{C}=\text{O}$ );  **$^1\text{H NMR}$**  (500 MHz,  $\text{DMSO}-d_6$ ):  $\delta$  ppm 3.22 (*t*, 1H, CH propargyl), 4.22 (*s*, 2H,  $\text{N}-\text{CH}_2$ ), 7.03–7.42 (*m*, 10, Ar–H), 9.78 (*s*, 1H, NH);  **$^{13}\text{C NMR}$** : 28.01 ( $\text{N}-\text{CH}_2$ ); 74.40 (CH propargyl); 69.71 (C–2Ph); 74.40 ( $\text{C}_q$  propargyl); 127.25, 128.00, 128.58, 140.15 (C–Ar); 154.57 ( $\text{C}=\text{O}$ ); 172.73 ( $\text{C}=\text{O}$ ). **HRMS (ESI)**: calculated for  $\text{C}_{18}\text{H}_{14}\text{N}_2\text{O}_2$  [ $M + \text{H}]^+$  291.1055; found 291.1122.

## 7. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. The carbon-bound H atoms were placed in calculated positions and refined isotropically using the riding model, with C–H distances ranging from 0.95 to 0.99 Å and  $U_{\text{iso}}(\text{H})$  set to 1.2–1.5  $U_{\text{eq}}(\text{C})$ . The H atoms H2A and H2B of the two imidazole rings were found in a difference-Fourier map and refined freely.

## Synthesis, crystal structure and Hirshfeld surface analysis of 5,5-di-phenyl-3-(prop-2-yn-1-yl)imidazolidine-2,4-dione

**Abderrazzak El Moutaoukil Ala Allah, Chiara Massera, Walid Guerrab, Abdulsalam Alsubari, Joel T. Mague and Youssef Ramli**

### Computing details

#### 5,5-Diphenyl-3-(2-propyn-1-yl)imidazolidine-2,4-dione

##### Crystal data

C<sub>18</sub>H<sub>14</sub>N<sub>2</sub>O<sub>2</sub>  
 $M_r = 290.31$   
Triclinic, P1  
 $a = 11.3526 (3)$  Å  
 $b = 12.0162 (3)$  Å  
 $c = 13.3087 (3)$  Å  
 $\alpha = 97.080 (1)$ °  
 $\beta = 114.406 (1)$ °  
 $\gamma = 107.335 (1)$ °  
 $V = 1513.47 (7)$  Å<sup>3</sup>

Z = 4  
F(000) = 608  
 $D_x = 1.274 \text{ Mg m}^{-3}$   
Cu K $\alpha$  radiation,  $\lambda = 1.54178$  Å  
Cell parameters from 1278 reflections  
 $\theta = 3.8\text{--}72.3$ °  
 $\mu = 0.68 \text{ mm}^{-1}$   
T = 200 K  
Prismatic, colourless  
0.17 × 0.15 × 0.10 mm

##### Data collection

Bruker D8 Venture PhotonII  
diffractometer  
Radiation source: fine-focus sealed tube  
Graphite monochromator  
phi & ω scan  
Absorption correction: multi-scan  
(SADABS; Krause et al., 2015)  
 $T_{\min} = 0.639$ ,  $T_{\max} = 0.754$

17923 measured reflections  
5879 independent reflections  
5126 reflections with  $I > 2\sigma(I)$   
 $R_{\text{int}} = 0.040$   
 $\theta_{\max} = 72.3$ °,  $\theta_{\min} = 3.8$ °  
 $h = -13 \rightarrow 13$   
 $k = -14 \rightarrow 14$   
 $l = -16 \rightarrow 16$

##### Refinement

Refinement on  $F^2$   
Least-squares matrix: full  
 $R[F^2 > 2\sigma(F^2)] = 0.040$   
 $wR(F^2) = 0.117$   
S = 1.02  
5879 reflections  
406 parameters  
0 restraints  
Hydrogen site location: mixed

H atoms treated by a mixture of independent  
and constrained refinement  
 $w = 1/[\sigma^2(F_o^2) + (0.0647P)^2 + 0.2418P]$   
where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} < 0.001$   
 $\Delta\rho_{\max} = 0.23 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.23 \text{ e } \text{\AA}^{-3}$   
Extinction correction: SHELXL-2019/2  
(Sheldrick 2015*b*),  
 $F_c^* = kF_c[1 + 0.001xF_c^2\lambda^3/\sin(2\theta)]^{-1/4}$   
Extinction coefficient: 0.0056 (5)

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

*Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters ( $\text{\AA}^2$ )*
