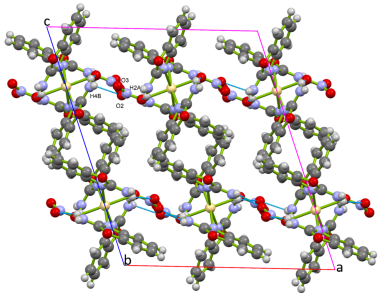
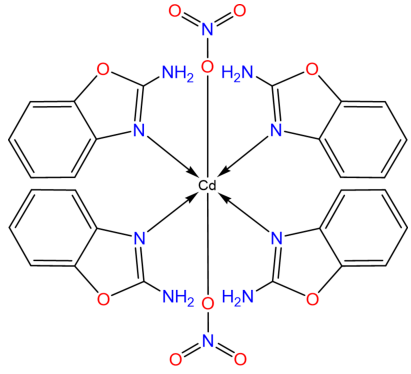
A coordination complex of cadmium nitrate $[Cd(NO_3)_2]$ with 2-aminobenzaxole (2AB; $C_7H_6N_2O$), namely, tetrakis(2-aminobenzoxazole-κN^1)bis(nitrato-κO) cadmium(II), $[Cd(NO_3)_2(2AB)_4]$, has been synthesized from ethanol solutions of $Cd(NO_3)_2{\cdot}H_2O$ and 2AB. The asymmetric unit comprises half a molecule of $[Cd(NO_3)_2(2AB)_4]$, with the Cd^{II} atom positioned on a twofold rotation axis. In the completed molecular complex, four 2AB ligands and two nitrate anions each coordinate monodentately to the Cd^{II} atom, leading to a distorted octahedral coordination environment. The crystal structure of $[Cd(NO_3)_2(2AB)_4]$ exhibits several N—H···O interactions, resulting in the formation of a layered assembly parallel to (001). Hishfeld surface analysis was used to quantify the intermolecular interactions.

1. Chemical context

Benzoxazole is a heterocyclic aromatic compound consisting of a benzene ring fused to an oxazole ring. It has a strong and unpleasant fishy odour, just like pyridine (Katritzky & Pozharskii, 2000; Clayden *et al.*, 2001). Many benzoxazole-based compounds are valued in medicinal and biological research because of their numerous biological activities (Potashman *et al.*, 2007; Šlachtová. & Brulíková, 2018; Razzoqova *et al.*, 2022, 2024), including antimicrobial (Erol *et al.*, 2022), antitumor (Imaizumi *et al.*, 2020), anti-inflammatory (Parlapalli & Manda, 2017), analgesic (Ali *et al.*, 2022; Sattar *et al.*, 2020), antitubercular (Šlachtová & Brulíková, 2018), herbicidal (Sangi *et al.*, 2019), and fungicidal properties (Fan *et al.*, 2022).





At the same time, 2-aminobenzoxazole (2AB) and its derivatives have potent antibacterial and anticancer properties (Paramashivappa *et al.*, 2003; Khajondetchairit *et al.*, 2017; Ouyang *et al.*, 2012). One notable derivative of 2AB is 2-amino-5-chlorobenzoxazole, which has demonstrated muscle relaxant effects and is used as an antispasmodic and uricosuric agent in therapeutic applications (Lynch, 2004).

In the context given above, we present here the synthesis, crystal structure determination and Hirshfeld surface analysis of a coordination complex of 2AB with cadmium nitrate, $[Cd(NO_3)_2(2AB)_4]$.

2. Structural commentary

In the asymmetric unit of $[Cd(NO_3)_2(2AB)_4]$, which consists of half of a complex molecule, the Cd^{II} atom is positioned on a twofold rotation axis (multiplicity 4, Wyckoff letter *e*). In the completed molecule, the Cd^{II} atom coordinates by four 2AB ligands and two nitrate anions, resulting in a distorted octahedral N_4O_2 coordination set (Fig. 1). The four 2AB ligands occupy the equatorial positions and are coordinated monodentately through their aromatic nitrogen donor atoms with Cd—N bond lengths of 2.314 (3) and 2.325 (3) Å. The two axially positioned nitrato ligands are also coordinated in a monodentate fashion with a relatively long Cd—O bond length of 2.418 (3) Å. The dihedral angle formed between the two opposite 2-aminobenzaxazole ligands (labelled in Fig. 1) is 84.85 (17)°. The molecular conformation is stabilized by intramolecular N—H···O hydrogen-bonding interactions involving the coordinated oxygen atom O1 and the non-coordinated oxygen atom O2 (entries #1 and #3 in Table 1).

Table 1
Hydrogen-bond geometry (Å, °).

D—H···*A*	*D*—H	H···*A*	*D*···*A*	*D*—H···*A*
N4—H4*A*···O1^{i}	0.86	2.26	2.971 (5)	140
N4—H4*B*···O2^{ii}	0.86	2.28	2.822 (6)	121
N2—H2*A*···O2^{i}	0.86	2.11	2.899 (7)	152
N2—H2*B*···O3^{iii}	0.86	2.33	2.953 (6)	129

Symmetry codes: (i) $-x+1, y, -z+\frac{3}{2}$; (ii) $x+\frac{1}{2}, y-\frac{1}{2}, z$; (iii) $x+\frac{1}{2}, y+\frac{1}{2}, z$.

3. Supramolecular features

In the crystal structure of $[Cd(NO_3)_2(2AB)_4]$, intermolecular N—H···O hydrogen bonds involving the non-coordinated O atoms O2 and O3 (entries #2 and #4 in Table 1) lead to the formation of sheets extending parallel to (001), as shown in Fig. 2.

4. Hirshfeld Surface Analysis

Hirshfeld surface (HS) analysis (Spackman & Jayatilaka, 2009) was performed and two-dimensional fingerprint plots (Spackman & McKinnon, 2002) were generated using *CrystalExplorer* (Spackman *et al.*, 2021) to quantify the intermolecular interactions. HS and fingerprint plot analysis conducted for $[Cd(NO_3)_2(2AB)_4]$ are graphically displayed in Fig. 3. The red spots on the HS area of $[Cd(NO_3)_2(2AB)_4]$ confirm the close intermolecular N—H···O contacts (related to entries #2 and #4 in Table 1) between adjacent molecules. The two-dimensional fingerprint plots and their relative

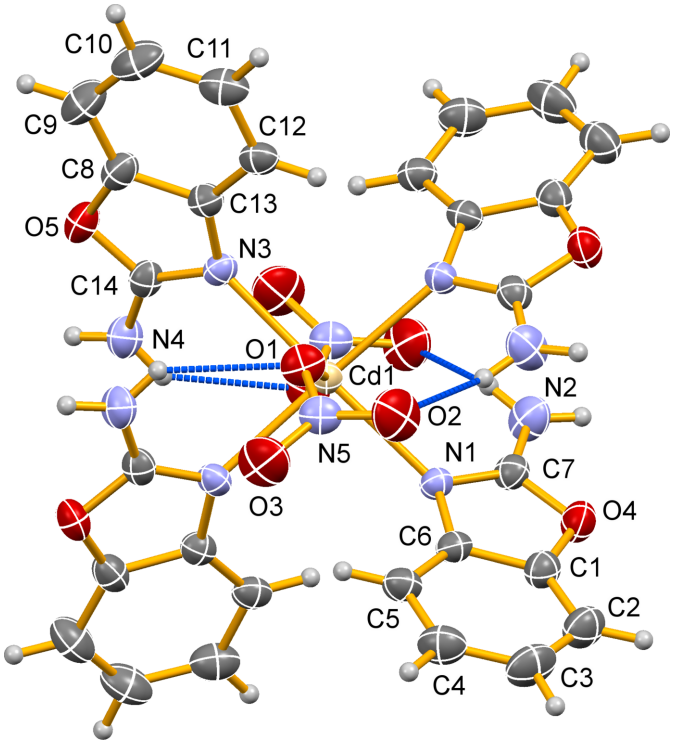


Figure 1
The molecular structure of $[Cd(NO_3)_2(2AB)_4]$ with displacement ellipsoids drawn at the 30% probability level; non-labelled atoms are generated by symmetry code $-x+1, y, -z+\frac{3}{2}$. Intramolecular hydrogen bonds are indicated by dashed blue lines.

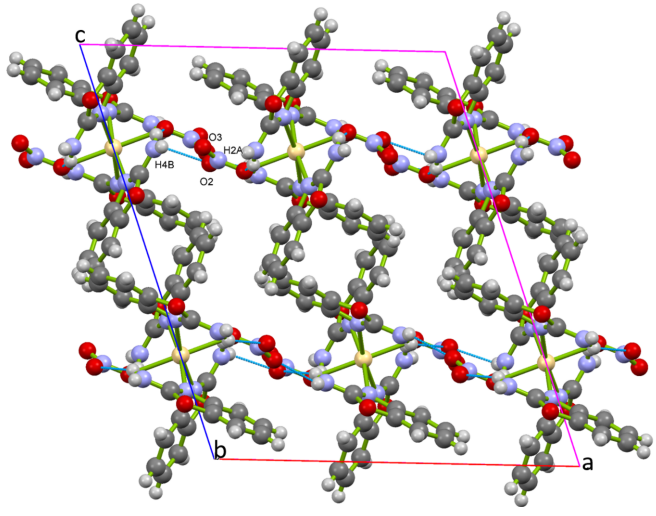

Figure 2
Visualization of the molecular packing in $[Cd(NO_3)_2(2AB)_4]$ in a view along [010]. Intermolecular N—H···O interactions are shows as light-blue dashed lines.

contributions revealed that H···H, O···H, C···H, C···O, O···O and N···H interactions are the main interactions to the HS area. Specifically, the fingerprint plots reveal the presence of close N—H···O contacts in form of two spikes observed near ($d_i + d_e$) ≃ 2.3 Å and C—H contacts as two wings near ($d_i + d_e$) ≃ 2. 8 Å (Fig. 3).

5. Database survey

A survey of the Cambridge Structural Database (CSD, Version 5.46, November 2024; Groom *et al.*, 2016) revealed 17 crystal structures of 2-aminobenzoxazole derivatives. Among these, only two structures involve coordination compounds with zinc (QALXIL; Decken & Gossage, 2005) and cadmium (DIWPIM; Razzoqova *et al.*, 2023). In the zinc complex, the central metal atom coordinates two benzoxazolamine ligands through the aromatic nitrogen atom and two chloro ligands in a distorted tetrahedral coordination environment. In the crystal structure of DIWPIM, which corresponds to $[Cd(2AB)_2(CH_3COO)_2]$, the Cd^{II} atom coordinates by two 2AB ligands and two acetato ligands in a monodentate and bidentate fashion, respectively, forming a distorted octahedral N_2O_4 coordination set.

6. Synthesis and crystallization

$Cd(NO_3)_2{\cdot}H_2O$ (0.308 g, 1 mmol) and 2AB (0.268 g, 2 mmol) were dissolved separately in ethanol (5 ml), mixed together and stirred for 2 h. The obtained colourless solution was filtered and left for crystallization. Single crystals of the complex $[Cd(NO_3)_2(2AB)_4]$ suitable for X-ray analysis were obtained by slow evaporation of the solution over a period of 7 d.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
