A new chain-like polyrotaxane Zn^{II} coordination polymer, *catena*-poly[[[(pyridine-2,6-dicarboxylato- κ^3 O,N,O')zinc(II)]- μ -1,4-bis(1H-imidazol-1-ylmethyl)-benzene- κ^2 N¹:N^{1'}] hemi{bis[μ -1,4-bis(1H-imidazol-1-ylmethyl)benzene- κ^2 N¹:N^{1'}]-bis[(pyridine-2,6-dicarboxylato- κ^3 O,N,O')zinc(II)]}] nonahydrate], {[Zn(C₇H₃NO₄)(C₁₄H₁₄N₄)][Zn₂(C₇H₃NO₄)₂(C₁₄H₁₄N₄)₂]_{0.5}·9H₂O]_n or {[Zn₂(2,6-PDC)₂-(bix)₂·9H₂O]_n [where 2,6-PDC = pyridine-2,6-dicarboxylate, C₇H₃NO₄, and bix = 1,4-bis(1H-imidazol-1-ylmethyl)benzene, C₁₄H₁₄N₄]}, was synthesized and characterized. The molecular structure comprises two Zn^{II} units. Both Zn^{II} ions are fivefold coordinated, with the coordination sphere intermediate between trigonal-bipyramidal and square-pyramidal, as defined by two bix ligands and one 2,6-PDC tridentate chelating ligand. For one of the units, two Zn^{II} ions are bridged by gauche-bix ligands, providing a dinuclear [Zn₂(2,6-PDC)₂(bix)₂] macrocycle. The other unit is built by trans-bix bridging ligands, leading to a zigzag chain-like structure. Interestingly, these two entities are interwoven, leading to a polyrotaxane structure extending parallel to [101]. The crystal structure is consolidated by hydrogen-bonding, π - π and C—H··· π intermolecular interactions.

1. Chemical context

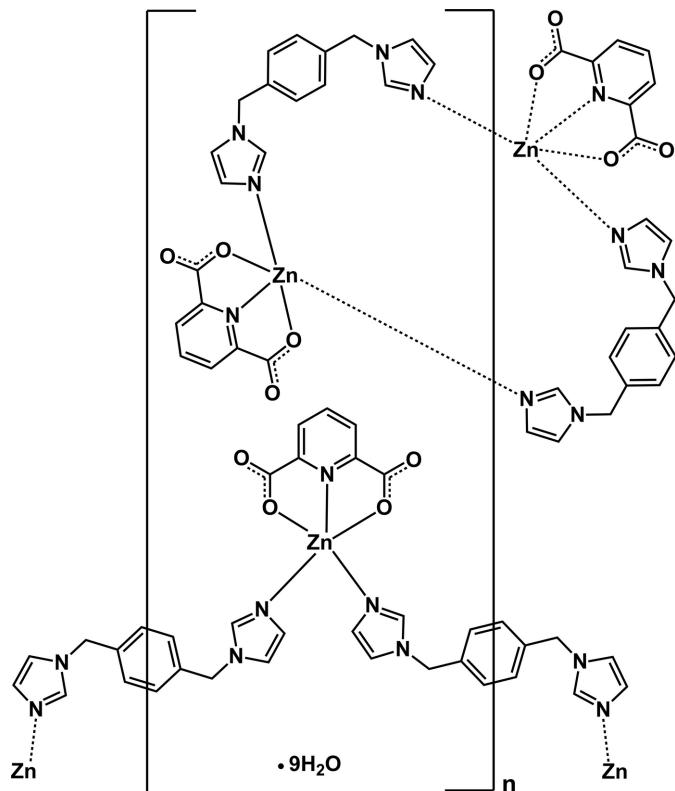

Coordination polymers (CPs) are inorganic–organic materials composed of metal ions linked by organic ligands through coordinate-covalent bonds into structural units with different periodicity (Robin & Fromm, 2006; Batten *et al.*, 2012). These materials possess potential for applications in various fields, such as gas storage, separation, luminescence, magnetism, catalysis, and drug delivery (Fromm *et al.*, 2009; Batten *et al.*, 2016; Kothawade & Shende, 2024; Dragutan *et al.*, 2024). Among these materials, CPs of Zn^{II} are very attractive due to their varieties of structural arrangements and also their properties. The Zn^{II} atom has an [Ar]3d¹⁰ closed-shell electron configuration, and corresponding structure–property relationships are studied for applications like luminescence (Parmar *et al.*, 2020; Diana *et al.*, 2021; Li *et al.*, 2023). To create novel Zn^{II} CPs with interesting structures and properties, mixed O- and N-donor ligands can be utilized (Robin *et al.*, 2006; Du *et al.*, 2013). Bridging O-donor ligands, in particular heterocyclic aromatic dicarboxylic acid ligands such as pyridinedicarboxylate (PDC), can provide a variety of coordination modes with central metal ions, yielding a variety of framework periodicities and topologies (Gao *et al.*, 2006). Furthermore, the selection of ligands with carboxylate groups and aromatic rings can promote hydrogen-bonding and π - π

Published under a CC BY 4.0 licence

intermolecular interactions, respectively, thus contributing to the stabilization of the crystal structure. For *N*-donor bridging ligands, the incorporation of flexible diimidazole ligands such as 1,4-bis(imidazol-1-ylmethyl)benzene (bix), which consists of two imidazole rings linked by a methylene group to a benzene ring, can result in two possible coordination conformations with the central metal ion, *gauche* and *trans*, and consequently leads to a variety of extended CP periodicities and topologies (Tripuramallu *et al.*, 2012; Adarsh *et al.*, 2016; Li *et al.*, 2018). Zn^{II} CPs containing mixed PDC and *trans*-bix derivatives have been reported, for instance in the form of a grid structure [Zn(2,3-PDCO)(bix)·H₂O]_n (2,3-PDCOH₂ = pyridine-2,3-dicarboxylic acid *N*-oxide) (Wen *et al.*, 2009), a corrugated network [Zn(2,6-PDC)(bmix)_{0.5}]_n [2,6-PDCH₂ = pyridine-2,6-dicarboxylic acid and bmix = 1,4-bis(2-methyl-imidazole-1-ylmethyl)benzene; Liu *et al.*, 2011], and a zigzag chain [Zn(3,4-PDC)(bix)]_n (3,4-PDCH₂ = pyridine-3,4-dicarboxylic acid) (Voda *et al.*, 2017). Notably, the flexibility of the bix ligand with both *gauche*- and *trans*-conformations can facilitate the formation of interesting Zn^{II} CP topologies, for example a mono-periodic polyrotaxane, {[Zn(Or)(bix)·(H₂O)]₂·6H₂O}_n (OrK = potassium orotate) (Somnath *et al.*, 2022).

The current report is part of a study aimed at the synthesis of new Zn^{II} CPs using pyridine-2,6-dicarboxylate (2,6-PDC) and 1,4-bis(imidazol-1-ylmethyl)benzene (bix) by investigation of various synthetic conditions, including compositions, solvents, and methods, leading to a new chain-like polyrotaxane Zn^{II} CP, {[Zn₂(2,6-PDC)₂(bix)₂]·9H₂O}_n.

2. Structural commentary

The asymmetric unit of the title compound consists of two Zn^{II} atoms, one bix and two half-bix ligands, which sit across a twofold rotation axis, two 2,6-PDC ligands and nine non-coordinating water molecules (Fig. 1). Selected bond lengths and angles are listed in Table 1. The coordination number of both the Zn1 and Zn2 atoms is 5 (Fig. 2). The environment of Zn1 is defined by two *N*-donor atoms from two bix ligands and one N and two O atoms from a terminal 2,6-PDC tridentate chelating ligand. The Zn1—N distances range from 1.984 (3) to 2.014 (3) Å, and the Zn1—O distances are 2.151 (3) and 2.208 (3) Å. The structural parameter τ_5 of Zn1 is 0.46 (Fig. S1 in the electronic supporting information, ESI), and thus the

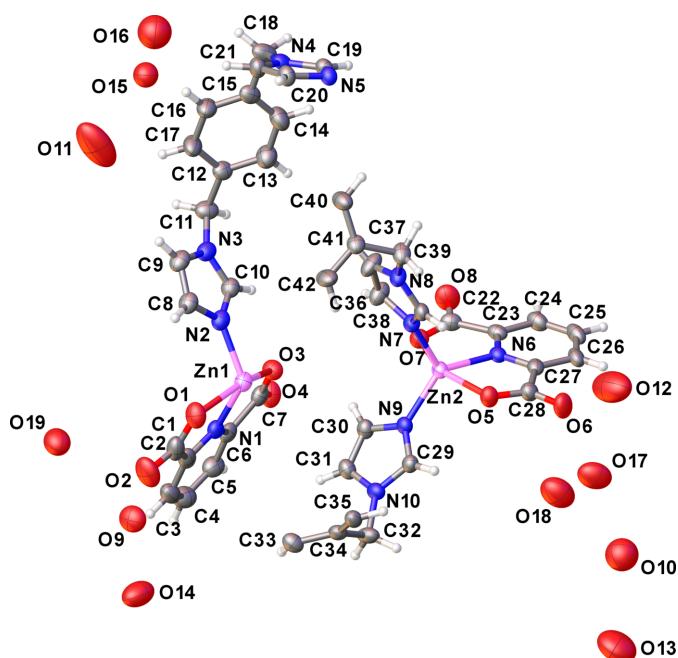

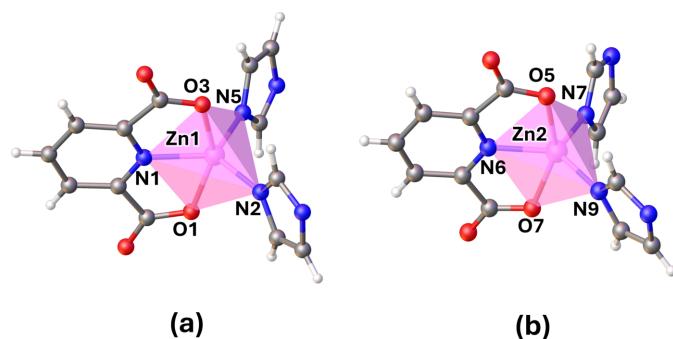

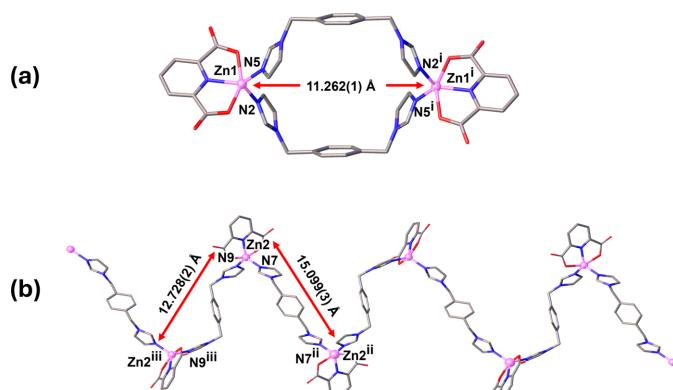

Figure 1

The asymmetric unit of the title compound. Zn1 is located in the center of inversion symmetry positions and two half-bix ligands sit across a twofold rotation axis. Displacement ellipsoids are drawn at the 30% probability level.

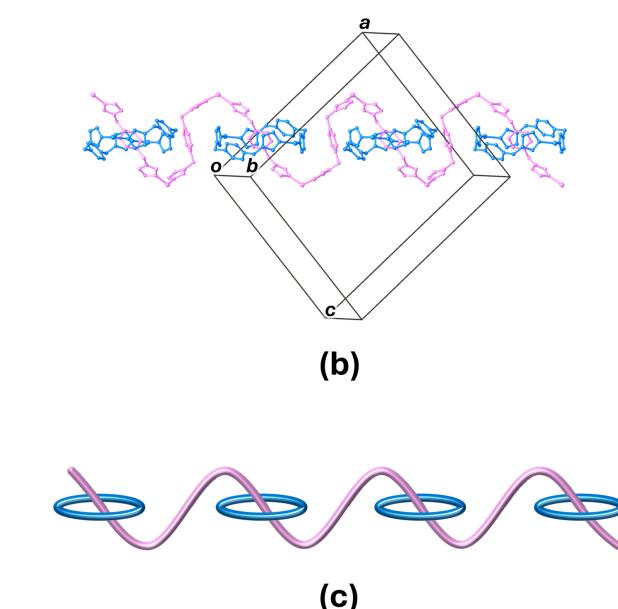

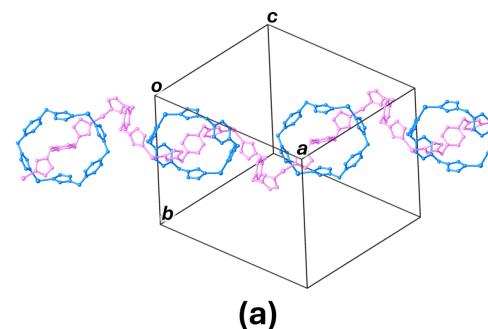

**Figure 2**

The coordination environment of the central Zn^{II} atoms in the title compound.

coordination environment is intermediate between a square pyramid and a trigonal bipyramidal ($\tau = 0$ for an ideal square pyramid and $\tau = 1$ for an ideal trigonal bipyramidal; Addison *et al.*, 1984). Two Zn1 ions are linked by two *gauche*-bix bridging ligands with $\mu\text{-}\kappa^2\text{N:N'}$ -coordination mode, forming a dinuclear $[\text{Zn}_2(2,6\text{-PDC})_2(\text{bix})_2]$ macrocyclic unit (Fig. 3a). The $\text{Zn1}\cdots\text{Zn1}^{\text{i}}$ distance across the dinuclear unit is $11.262(1)$ Å [symmetry code: (i) $-x + \frac{1}{2}, -y - \frac{1}{2}, -z + 1$]. The environment around Zn2 is defined by two *N*-donor atoms from two bix ligands and one *O*- and two *N*-donor atoms from a terminal 2,6-PDC tridentate chelating ligand. The $\text{Zn2}-\text{N}$ distances are in the range $1.984(3)$ to $2.010(3)$ Å and the $\text{Zn2}-\text{O}$ distances are $2.172(3)$ and $2.209(3)$ Å. The value of τ_5 is 0.42 (Fig. S1 in the ESI), indicating an intermediate five-coordinate environment similar to the degree of distortion found around Zn1 . The Zn2 atoms are linked by the *trans*-bix bridging ligand with $\mu\text{-}\kappa^2\text{N:N'}$ -coordination modes, leading to a zigzag chain-like structure extending parallel to [101] (Fig. 3b and Fig. S1 in the ESI). The $\text{Zn2}\cdots\text{Zn2}^{\text{ii}}$ and $\text{Zn2}\cdots\text{Zn2}^{\text{iii}}$ distances are $15.099(3)$ and $12.728(2)$ Å, respectively [symmetry codes: (ii) $-x + \frac{1}{2}, -y + \frac{1}{2}, -z + 2$; (iii) $= -x, y, -z + \frac{3}{2}$]. Interestingly, the zigzag chains involving Zn2 represent the threading into the dinuclear $[\text{Zn}_2(2,6\text{-PDC})_2(\text{bix})_2]$ macrocyclic units, providing an extended mono-periodic polyrotaxane structure parallel to [101], as shown in Fig. 4 and Fig. S2 in the ESI.

Symmetry codes: (i) $-x + \frac{1}{2}, -y - \frac{1}{2}, -z + 1$; (ii) $x + \frac{1}{2}, y - \frac{1}{2}, z$; (iii) $-x + \frac{1}{2}, y - \frac{1}{2}, -z + \frac{3}{2}$; (iv) $x, -y, z + \frac{1}{2}$; (v) $-x + \frac{1}{2}, -y + \frac{1}{2}, -z + 1$.

characterizing these conformations are summarized in Table S1 in the ESI. In the bix ligand within the Zn1 unit, the imidazole rings {N2N3;N4N5} display a synperiplanar conformation, characterized by a torsion angle (τ_3) of 7.90° (through N3—C11—C18—N4). The imidazole rings are twisted with respect to the phenyl ring with torsion angles (τ_1) of $67.4(6)^\circ$ (through C9—N3—C11—C12) and (τ_2) of $-83.8(5)^\circ$ (through C21—N4—C18—C15), indicating a *gauche* conformation. The two independent bix ligands in the Zn2 unit, related by twofold rotation symmetry, show different conformations. For the {N7N8;N8'N7'} rings, an antiperiplanar twist is observed, with a torsion angle (τ_3) of 180.00° (through N8—C39—C39'—N8'). The twist relative to the phenyl ring is defined by torsion angles (τ_1) and (τ_2) of -48.90 and 48.90° , respectively. For the {N9N10;N10'N9'} rings, the imidazole rings show a near antiperiplanar conformation, with a torsion angle (τ_3) of 160.10° (through N10—C32—C32'—N10'), and the twist relative to the phenyl ring defined by a torsion angles (τ_1 and τ_2) of $78.7(5)^\circ$. These parameters correspond to a *trans*-conformation for the Zn2 unit. Consequently, the difference of these bix conformations also affect the metal–metal separation (Tripuramallu *et al.*, 2012) in the title compound.

3. Supramolecular features

The crystal structure of the title compound is consolidated by the presence of a variety of intermolecular interactions, namely hydrogen-bonding, $\pi\cdots\pi$ and C—H $\cdots\pi$ interactions, as detailed in Tables 2 and 3. It is noted that the hydrogen atoms bonded to the oxygen atoms of non-coordinating water molecules were not assigned in the structure, but the O \cdots O

**Figure 6**

The crystal packing of the title compound. The water molecules are omitted for clarity.

separations [O11 \cdots O12 = 3.096 (14) \AA , O12 \cdots O13 = 3.214 (16) \AA , O13 \cdots O14 = 2.882 (9) \AA , O10 \cdots O17 = 3.120 (16) \AA , O17 \cdots O18 = 2.862 (14) \AA , O16 \cdots O18 = 3.206 (19) \AA , O9 \cdots O18 = 2.876 (9) \AA] suggest the presence of medium-to-weak hydrogen-bonding interactions between them. Non-classical intermolecular hydrogen-bonding C—H \cdots O interactions are found between (i) the C—H group of the imidazole ring on the bix ligands and the oxygen atoms of the carboxylate group of the 2,6-PDC ligands (Fig. S5 in the ESI), and (ii) between the C—H groups of both the imidazole ring and the —CH₂ group on the bix ligands and the non-coordinating water molecules (Fig. S6 in the ESI). The $\pi\cdots\pi$ interactions are observed between the pyridine rings of 2,6-PDC ligands in adjacent zigzag chains with a centroid-to-centroid distance $Cg5\cdots Cg5^i$ of 3.646 (2) \AA and a slippage of 1.434 \AA [$Cg5$ is the centroid of the N6/C23—C27 ring; symmetry code: (i) $-x + \frac{1}{2}, -y + \frac{1}{2}, -z + 1$]. Additionally, $\pi\cdots\pi$ interactions are found between the pyridine rings of 2,6-PDC ligands in the adjacent zigzag chains and the dinuclear units with a centroid-to-centroid distance $Cg5\cdots Cg12^i$ of 3.729 (3) \AA and a slippage of 0.782 and 0.686 \AA ($Cg5$ and $Cg12$ are the centroids of the N6/C23—C27 and N1/C2—C6 rings), as shown in Fig. S7 in the ESI. Furthermore, C—H $\cdots\pi$ interactions are observed between the C—H groups of 2,6-PDC in the dinuclear units and the imidazole ring of the bix ligand in the zigzag chains, $C5-\text{H}5\cdots Cg3^v$ and $C26-\text{H}26\cdots Cg10^v$ [symmetry code: (v) $-x + \frac{1}{2}, -y + \frac{1}{2}, -z + 1$]. Additional interactions occur between a C—H group of the benzene ring of a bix ligand in the zigzag chains and the imidazole ring of the bix ligand in the dinuclear units, namely $C42-\text{H}42\cdots Cg11^{iv}$ [where $Cg3$, $Cg10$ and $Cg11$ are the centroids of

Table 3Analysis of short ring interactions (\AA).

$Cg(I)$ and $Cg(J)$ are the centroids of rings I and J ; CgI_Perp is the perpendicular distance of $Cg(I)$ on ring J , and slippage is the distance between $Cg(I)$ and the perpendicular projection of $Cg(J)$ on ring I . $Cg5$, and $Cg12$ are the centroids of the N6/C23—C27 and N1/C2—C6 rings, respectively.

the five-membered N7/C36–C38, N2/C8–C10 and N4/C19–C21 rings, respectively; symmetry code: (iv) $x, -y, z + \frac{1}{2}$, as shown in Fig. S8 in the ESI. The crystal packing of the title compound is shown in Fig. 6 and Fig. S9 in the ESI.

4. Spectroscopic, powder X-ray diffraction (PXRD) and thermal properties

The FT-IR spectrum of the title compound (Fig. S10 in the ESI) shows a strong broad band centered at 3434 cm⁻¹, assigned to the O–H stretching of water molecules. A band at 3127 cm⁻¹ is assigned to the C–H stretching of aromatic rings for both ligands. The characteristic bands found at 1639 and 1421 cm⁻¹ can be assigned to be the asymmetric and symmetric stretching vibrations of the carboxylate group of the 2,6-PDC ligand. Bands appearing at 1533 and 1097 cm⁻¹ could be assigned to the C≡N and C–N stretching, respectively, and the bands in the range of 700–500 cm⁻¹ to C–H bending vibration of bix ligands (Ttripuramallu *et al.*, 2012; Somnath *et al.*, 2022).

The PXRD patterns of the title compound are shown in Fig. S11 in the ESI, revealing a good match between the calculated pattern from single-crystal data and the experimental data of the as-synthesized compound, indicating that it was synthesized in a phase-pure manner.

To study the thermal stability of the title compound, thermogravimetric analysis (TGA) was performed in the temperature range of 303–1073 K under nitrogen atmosphere. From the TGA curve shown in Fig. S12 in the ESI, the first degradation step in the range of 303–403 K represents a mass loss of 17.30%, corresponding to the loss of the nine water molecules (calculated 17.45%). Then the resulting compound remained stable up to 573 K. The degradation steps observed in the temperature range of 573–833 K represents a mass loss of 51.59%, indicating the release of two bix and two 2,6-PDC ligands (calculated 50.74%). The remaining residue at high temperature could be assigned to ZnO.

5. Database survey

A search of the Cambridge Structural Database (CSD, version 5.44, last update April 2023; Groom *et al.*, 2016) using the ConQuest software (Bruno *et al.*, 2002) for structures of mixed 2,6-PDC and bix ligand-based Zn^{II} polyrotaxane CPs yielded no hits. To the best of our knowledge, only one relevant Zn^{II} CP containing mixed dicarboxylate, orotate (Or), and bix ligands, $[(\text{Zn}(\text{Or})(\text{bix})(\text{H}_2\text{O}))_2 \cdot 6\text{H}_2\text{O}]_n$ (PEFHAN; Somnath *et al.*, 2022), exhibiting a chain-like polyrotaxane structure, has been reported. Although the crystal structure of this compound exhibits both *gauche* and *trans* conformations of the bix ligand (like in the title compound), differences in moieties such as the orotate ligand and the number of water molecules, as well as variations in the degree of bix molecule flexibility and supramolecular interactions, make a direct comparison difficult.

6. Synthesis and crystallization

All chemicals purchased were reagent-grade and used without further purification. The bix ligand was prepared according to a literature procedure (Hoskins *et al.*, 1997). A dimethyl formamide solution (10 ml) of bix·2H₂O (0.2383 g, 1 mmol) was added to an aqueous solution (10 ml) of Zn(NO₃)₂·6H₂O (0.2975 g, 1 mmol) and stirred for 10 min at 333 K. Subsequently, a mixture of an aqueous solution (10 ml) of 2,6-PDCH₂ (0.1671 g, 1 mmol) and NaOH (0.0845 g, 2 mmol) was added, and the resulting mixture was stirred for 20 min, giving a colorless precipitate. Then, a mixed solution of DMF (10 ml) and deionized water (10 ml) was slowly added, and the mixture was stirred for 40 min. The solution became clear and colorless. This solution was filtered and allowed to slowly evaporate at room temperature. Colorless, block-shaped crystals of the title compound were obtained within one week (17.6% yield, based on the Zn^{II} salt).

7. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 4. Hydrogen atoms bonded to carbon atoms were placed at calculation positions and refined isotropically using a riding model with C–H = 0.93 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ for aromatic hydrogen atoms, and C–H

$= 0.97 \text{ \AA}$, $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ for methylene hydrogen atoms. The hydrogen atoms bonded to the oxygen atoms of the non-coordinating water molecules (O9–O19) could not be located reliably and thus were not included in the model, but were taken into account in the overall formula. Some of non-coordinating water molecules were refined with site occupancies of 0.75 for O10 and O12 and 0.5 for O17, while other water molecules (O15 and O16) were found to be disordered with site occupancies of 0.5.

Acknowledgements

We are thankful for the support from the Department of Chemistry, Faculty of Science and Technology, Thammasat University, and the Thammasat University Research Unit in Multifunctional Crystalline Materials and Applications (TUMCMA), Thammasat University.

Funding information

Funding for this research was provided by: Thammasat University Research Fund, Thammasat University. (contract No. TUFT 80/2564 to N. Wannarit).

Crystal structure and characterization of a new chain-like polyrotaxane zinc(II) coordination polymer with mixed pyridine-2,6-dicarboxylate and 1,4-bis(1*H*-imidazol-1-ylmethyl)benzene ligands

Chanikarn Kummuang, Kittipong Chainok and Nanthawat Wannarit

Computing details

*catena-Poly[[[[[(pyridine-2,6-dicarboxylato- κ^3O,N,O')zinc(II)]- μ -1,4-bis(1*H*-imidazol-1-ylmethyl)benzene- $\kappa^2N^1:N^1$] hemi{bis[μ -1,4-bis(1*H*-imidazol-1-ylmethyl)benzene- $\kappa^2N^1:N^1$]bis[(pyridine-2,6-dicarboxylato- κ^3O,N,O')zinc(II)]}] nonahydrate]*

Crystal data

[Zn(C₇H₃NO₄)(C₁₄H₁₄N₄)]
 [Zn₂(C₇H₃NO₄)₂(C₁₄H₁₄N₄)₂]_{0.5}·9H₂O
 $M_r = 1099.70$
 Monoclinic, $C2/c$
 $a = 25.577$ (4) Å
 $b = 18.632$ (3) Å
 $c = 22.463$ (4) Å
 $\beta = 94.335$ (6)°
 $V = 10674$ (3) Å³
 $Z = 8$

$F(000) = 4416$
 $D_x = 1.369$ Mg m⁻³
 Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
 Cell parameters from 9980 reflections
 $\theta = 2.6\text{--}25.9^\circ$
 $\mu = 0.97$ mm⁻¹
 $T = 296$ K
 Block, clear colourless
 $0.24 \times 0.2 \times 0.2$ mm

Data collection

Bruker D8 QUEST CMOS PHOTON II diffractometer
 Radiation source: sealed x-ray tube, Mo
 Graphite monochromator
 Detector resolution: 7.39 pixels mm⁻¹
 ω and φ scans
 Absorption correction: multi-scan (SADABS; Krause *et al.*, 2015)
 $T_{\min} = 0.685$, $T_{\max} = 0.746$

129120 measured reflections
 9915 independent reflections
 8159 reflections with $I > 2\sigma(I)$
 $R_{\text{int}} = 0.058$
 $\theta_{\max} = 25.5^\circ$, $\theta_{\min} = 2.6^\circ$
 $h = -30 \rightarrow 30$
 $k = -22 \rightarrow 22$
 $l = -27 \rightarrow 27$

Refinement

Refinement on F^2
 Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.055$
 $wR(F^2) = 0.185$
 $S = 1.05$
 9915 reflections
 658 parameters
 18 restraints
 Primary atom site location: iterative

Hydrogen site location: inferred from neighbouring sites
 H-atom parameters constrained
 $w = 1/[\sigma^2(F_o^2) + (0.1223P)^2 + 11.6285P]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 1.20$ e Å⁻³
 $\Delta\rho_{\min} = -0.56$ e Å⁻³

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
