

## book reviews

Works intended for this column should be sent direct to the Book-Review Editor, whose address appears in this issue. All reviews are also available from **Crystallography Journals Online**, supplemented where possible with direct links to the publisher's information.

## books received

The following books have been received by the Editor. Uncritical notices are given under this heading instead of reviews in order to facilitate rapid communication.

**Protein Condensation.** By J. D. Gunton, A. Shirayev and D. L. Pagan. Pp. xii+364. Cambridge University Press, 2007. Price (hardback) £70 (US\$ 135). ISBN 978-0-521-85121-3.

This book deals with the phase transitions, self-assembly and aggregation of proteins in solution. Its primary purpose is to bring to an interdisciplinary audience the state of the art in current research. The book discusses issues related to the production of high-quality protein crystals from solution, in which the bottleneck is crystal nucleation. The main challenge is to determine the initial solution conditions so that optimal

crystal nucleation occurs. The book also discusses diseases that occur because of undesired protein condensation, as, for example, sickle-cell anemia, cataracts and Alzheimer's disease. Current experimental and theoretical work on these diseases aims to understand the diseases at a fundamental molecular level, in order to prevent the undesired condensation from occurring. *Contents:* 1, Introduction; 2, Globular protein structure; 3, Experimental methods; 4, Thermodynamics and statistical mechanics; 5, Protein-protein interactions; 6, Theoretical studies of equilibrium; 7, Nucleation theory; 8, Experimental studies of nucleation; 9, Lysozyme; 10, Some other globular proteins; 11, Membrane proteins; 12, Crystallins and cataracts; 13, Sickle hemoglobin and sickle cell anemia; 14, Alzheimer's disease; 621 References; Index.
