The asymmetric unit of the title inorganic-organic salt, poly[di( $\mu_{2}$-2-hydroxypropanoato)cadmium $]$, $\left[\mathrm{Cd}\left(\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{3}\right)_{2}\right]_{n}$ or $\left[\mathrm{Cd}(\mathrm{Hlac})_{2}\right]_{n}\left(\mathrm{H}_{2}\right.$ lac $=2$-hydroxypropanoic acid), comprises of a cadmium cation and two 2-hydroxypropanoate anions. The cadmium cation exhibits a distorted pentagonal-bipyramidal coordination environment defined by the hydroxy and carbonyl O atoms of the 2-hydroxypropanoate anions. The coordination mode leads to the formation of layers extending parallel to (010). $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonding between the hydroxy and carbonyl groups stabilizes the structure packing.

## Structure description

Compounds with metal-organic framework (MOF) structures with accessible open space have rapidly grown into a major area of chemical research because of their structural diversity and wide applications (Furukawa et al., 2013). Crystal engineering of MOFs has been dominated by single organic units like polycarboxylates, polypyridines, azolate or their derivatives. Recently, mixed-ligand MOFs (Yin et al., 2015), were found to be successful in the rational construction of materials with targeted functionalities. One of the interesting candidates for the construction of mixed-ligand MOFs is 2-hydroxypropanoic acid $\left(\mathrm{H}_{2} \mathrm{lac}\right)$. Working with the corresponding anion has several advantages: (i) multiple coordination modes by using the hydroxyl and carboxyl groups are possible; (ii) the anion is flexible and a chelating ligand, and thus can facilitate the formation of key building units such as chains or layers; (iii) the terminal methyl group can be replaced by $-\mathrm{H},-\mathrm{C}_{2} \mathrm{H}_{5},-\mathrm{Ph}$ and other groups for structural regulation and expansion. As a typical example, the combination of $\mathrm{H}_{2} \mathrm{lac}$ and linear pyridine carboxylate generates highly stable rod-spacer MOFs with double $\pi$-wall and square nano-channels (Zeng et al., 2010), achieving high-efficiency iodine capture.

During exploration of the coordination chemistry of $\mathrm{H}_{2} \mathrm{lac}$ with different metals and co-ligands, the title compound was obtained as a single-ligand cadmium compound,

notwithstanding the presence of the linear pyrazine co-ligand under the given solvothermal conditions. The asymmetric unit of the title compound comprises of one cadmium cation and two 2-hydroxypropanoate anions (Fig. 1). The Cd1 cation is sevenfold-coordinated by oxygen and adopts a distorted pentagonal-bipyramidal coordination environment. Four oxygen atoms stem from carboxyl groups and three from hydroxyl groups from four different $\mathrm{Hlac}^{-}$ligands whereby three ligands are chelating and one is monodentate. This coordination mode leads to the formation of layers extending parallel to (010) (Fig. 2, left). Under consideration of the Cd as nodes, the cations are extended to tapes parallel to [001] consisting of a $(4,4)$ grid (Fig. 2, right). The tapes are stacked along [100] and are linked into a three-dimensional network by more distant nodes [Cd…Cd distances of 6.4014 (14) $\AA$ ] parallel to [210]. The crystal packing is consolidated by $\mathrm{O}-$ $\mathrm{H} \cdots \mathrm{O}$ hydrogen-bonding interactions of medium strength between hydroxy and carbonyl functions, and additional weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions (Table 1).

## Synthesis and crystallization

A mixture of $\mathrm{H}_{2} \mathrm{lac}$ ( 0.125 mmol ), pyrazine ( 0.1 mmol ) and $\mathrm{Cd}\left(\mathrm{NO}_{3}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}(0.2 \mathrm{mmol})$ in $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(15 \mathrm{ml})$ was stirred in air with a magnetic stirrer, generating a colourless clear solution after 10 min . The reaction solution was then transferred to a solvothermal PTFE reaction vessel with 25 ml capacity, followed by heating at 393 K for 72 h . The reaction vessel was then cooled to room temperature at a rate of $10 \mathrm{~K} \mathrm{~h}^{-1}$. The formed crystalline material was filtered to obtain colourless rod-like crystals with a yield of about $52 \%$ (based on Cd). The obtained crystals are insoluble in common

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. The H atoms (H3 and H 6 ) bound to the O 3 and O 6 atoms were located from a difference-Fourier map. The $\mathrm{O}-\mathrm{H}$ bond lengths were restrained by DFIX command to be $0.85 \AA$. The DANG command was used for H3 and H6 to restrain their orientation. Due to unresolved disorder of the methyl groups involving C3 and C6, the latter atoms were treated with ISOR commands.
